I. PROPOSAL

DATE OF PROPOSAL: July 31, 2013

CONTACT: Karen Grimmer
99 Pacific Avenue, Suite 455A
Monterey, CA 93940

BACKGROUND

Designated in 1992, Monterey Bay National Marine Sanctuary (MBNMS) is a federally protected marine area offshore of California's central coast. Stretching from Marin to Cambria, the sanctuary encompasses a shoreline length of 276 miles and 4,601 square nautical miles of ocean, extending an average distance of 30 miles from shore. At its deepest point, the MBNMS reaches 12,713 feet (more than two miles). It is one of our nation's largest marine sanctuaries.

The habitats in the sanctuary harbor a variety of marine life, including 34 species of marine mammals, more than 180 species of seabirds and shorebirds, 537 species of fishes and an abundance of invertebrates and algae. The area supports commercial fisheries, including local fishermen from Half Moon Bay, Monterey Bay and Morro Bay.

On behalf of the collaborating organizations, MBNMS is submitting a proposal to the Pacific Fishery Management Council (PFMC) to modify boundaries for the Groundfish Essential Fish Habitat (EFH) 5-year Review Process. The proposal reflects a review of new information, and requests that the Council consider modifying the following suite of spatial management measures that were designed using the best available information for federal waters of MBNMS, south of Año Nuevo. . The approach used for developing this proposal addresses the ongoing requirement to minimize to the extent practicable adverse impacts of fishing on EFH, and requests the following:

1. Spatial modifications to EFH designations that restrict bottom trawl gear by a) adding additional area to existing EFH Conservation Areas; b) proposing new EFH Conservation Areas designations; c) proposing new designations of Habitat Areas of Particular Concern (HAPC) "Areas of Interest"; and d) proposing re-opening of certain areas from existing EFH Conservation Areas to allow access to key historically bottom trawled areas of economic importance (see Table 1);
2. Voluntary management areas - non regulatory areas that are adopted by fishermen as no bottom trawl zones as a pilot project to be evaluated and monitored by the sanctuary to determine their effectiveness;
3. Changes to enforcement of spatial areas. This would include requiring the use of hydraulic sensors, changing VMS pings from 1 hour to 15 minute intervals, and the use of electronic logbooks; and
4. Benthic research and monitoring to collect baseline visual data in the modified areas.

MBNMS has developed the parameters of a proposal based on the Groundfish EFH Review Phase I Report (September 2012), the EFH Synthesis Report (April 2013), and has provided additional information about the geology, biogenic habitat and groundfish located within the proposed areas. This

proposal was developed to be principally consistent with the The Magnuson-Stevens Fishery Conservation and Management Act (MSA) requirements pertaining to EFH and the management measures and designations for EFH as outlined in the Councils Pacific Coast Groundfish Fishery Management Plan (FMP). In addition, the MSA allows NOAA to manage fishing-related threats to deep-sea corals and sponges in federal waters through FMPs developed in conjunction with the Regional Fishery Management Councils. The MSA was amended in 2007, requiring NOAA to establish the Deep Sea Coral Research and Technology Program and providing new discretionary authority to protect deep-sea coral and sponge areas from damage caused by fishing gear. The proposal is also consistent with strategies in the MBNMS management plan that address bottom trawling effects on benthic habitat, ecosystem monitoring, and fishing-related outreach.

Table 1: Summary of Modifications to EFH Conservation Area Boundaries

Area #	EFH Modification	Site Name	Total Area Added (sq st mi)	Total Area Removed (sq st mi)
1	add to EFH	Ascension and Año Nuevo Canyon Complex	30.43	
2	add to EFH	South of Davenport	9.78	
3	reopen EFH	Lower Portion of Cabrillo Canyon		26.87
4	add to EFH	Outer Soquel Canyon	9.70	
5	add to EFH	Southwest of Smooth Ridge	9.51	
6	reopen EFH	South of Mars Cable		1.46
7	reopen EFH	West of Carmel Canyon		14.27
8	add to EFH	West of Sobranes Point	37.56	
9	reopen EFH	East of Sur Ridge		42.12
10	add to EFH	Triangle South of Surveyors Knoll	14.34	
11	reopen EFH	Sur Canyon Slot Canyons		68.59
12	add to EFH	Point Sur Platform	16.61	
13	add to EFH	Between Partington Point and Lopez Point	113.80	
14	add to EFH	La Cruz Canyon Complex	13.40	
15	add to EFH	West of Piedras Blancas State Marine Conservation Area	4.48	
		TOTAL	259.60	153.31

MBNMS EFH Boundary Modifications

7/29/13

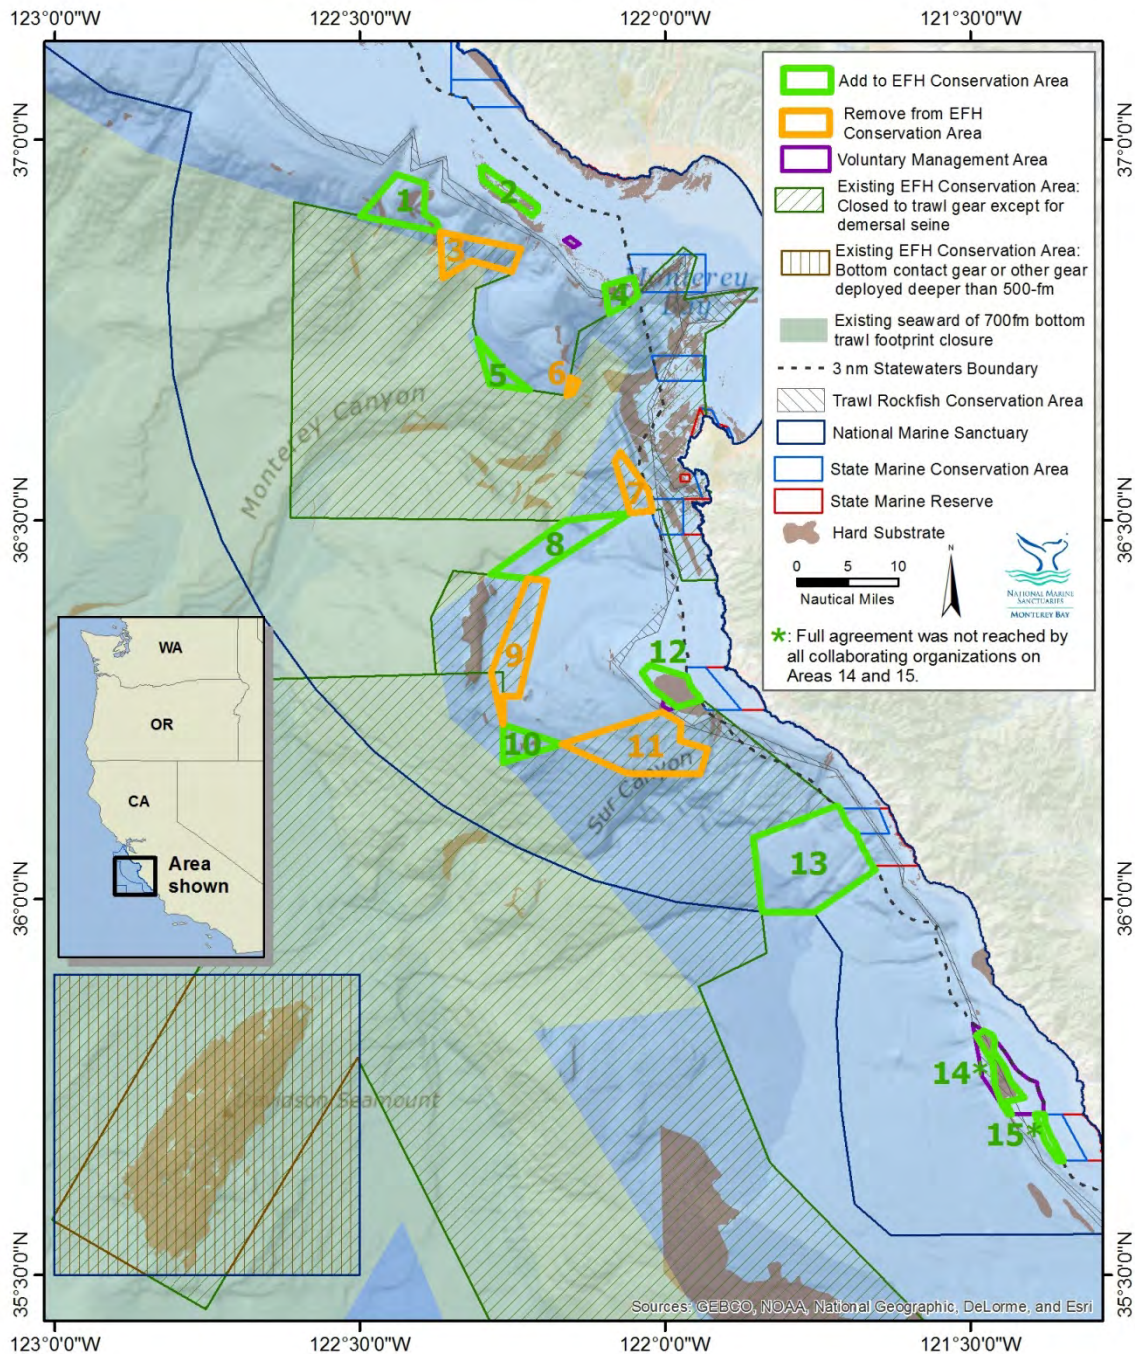

Figure 1: An overview map of all proposed EFH boundary modifications within the MBNMS study area, which is in Federal waters south of Año Nuevo and includes Davidson Seamount Management Zone

3a. Proposal Objectives:

This proposal represents the product of an eleven-month stakeholder process that began in August of 2012 with meetings among fishing industry stakeholders, and in June 2013 was expanded to include additional stakeholders, forming a group that represents MBNMS staff, MBNMS Advisory Council (SAC) representatives (Harbors and Commercial Fishing), Alliance of Communities for Sustainable Fisheries, Monterey Bay trawl fishermen, the City of Monterey, Oceana, Natural Resources Defense Council, Ocean Conservancy, The Nature Conservancy, the California Risk Pool and Environmental Defense Fund (see Appendix E).

- *Primary Goals:* To 1) identify and present information on habitat areas consistent with groundfish EFH within MBNMS that are currently not protected by EFH management measures that are unique, rare and/or ecologically sensitive either due to geologic features and/or contain known biogenic habitat (i.e. deep sea corals and sponges); and could be vulnerable to impacts of fishing activities managed by the Pacific Fishery Management Council; and 2) propose new EFH Habitat Areas of Particular Concern (HAPCs) and new Conservation Areas that minimize adverse fishing impacts to the extent practicable on groundfish EFH, and further the protection of both biogenic and physical habitat for Groundfish FMP species through prohibitions on bottom trawling; and 3) propose re-opening of certain sections of existing EFH Conservation Areas that will return valuable historical fishing grounds to the bottom trawl fleet. The overall goal of this proposal is to protect more total area and more sensitive habitats while improving fishing opportunities for the bottom trawl fleet relative to the current array of EFH Conservation Areas.
- *Objectives:*
 1. Present detailed, relevant data recently collected in the proposed areas that can assist the Council if they move forward with a proposed action; use as the basis for the proposal information summarized in the EFH Phase 1 report and the EFH Synthesis report.
 2. Propose Council consider designation of EFH Habitat Areas of Particular Concern (HAPC) "Areas of Interest" at Pt. Sur Platform and La Cruz Canyon.
 3. Propose protection of groundfish EFH, to the extent practicable, from bottom trawl gear at modified and newly proposed EFH Conservation Areas.
 4. Propose modifications of existing EFH Conservation Areas that re-open select areas to allow fishermen access to valuable, historic bottom trawl fishing grounds, while minimizing adverse impacts to groundfish EFH.
 5. Identify other measures that enhance protection and compliance

The approach for all stakeholder meetings was to work together using a scientific framework combined with local knowledge to develop a collaborative proposal for modifying EFH boundaries that considered both increased protection for groundfish EFH with opportunities for fishermen to access valuable fishing grounds. Combining scientific information on fishing grounds and benthic habitat with local fishing knowledge presents opportunities to discuss and discover goals for groundfish EFH shared by sanctuary managers, fishermen, scientists, and the conservation community. MBNMS recently completed a new management tool that identifies high value and/or sensitive benthic habitat - [Sanctuary Ecologically Significant Areas](#) (SESAs) (see Appendix D). The SESAs served as the basis for the sanctuary's initial areas of interest in discussions with fishermen and environmental groups. Some of the criteria in

developing SESAs have overlap with groundfish EFH criteria, and thus MBNMS was interested in looking for opportunities for enhanced conservation of groundfish EFH that overlapped with sanctuary goals for enhanced benthic habitat protection. The trawl fleet was interested in exploring opportunities to re-open valuable fishing grounds that prohibit bottom trawl gear in EFH designations from 2006. The conservation community developed their own areas of interest based on high value habitat assessments as well as identifying areas that were lightly trawled or not trawled at all. All three stakeholder groups had ideas for proposed changes to EFH boundary modifications and saw opportunities for collaboration on the dual goals of increasing habitat protections and enhancing healthy and sustainable fishing practices. Lastly, an important guiding principle for the stakeholder meetings emerged, which was to build a collaborative relationship and trust between the sanctuary, fishermen and the conservation community through this process.

For purposes of this EFH proposal, the MBNMS Study Area was established as: 1) Federal waters only, 2) Region south of Año Nuevo, and 3) Including Davidson Seamount Management Zone. The region north of Año Nuevo is managed by the Gulf of the Farallones National Marine Sanctuary (GFNMS). GFNMS implements the MBNMS regulations for all activities except water quality in this region. GFNMS is not submitting a proposal for this area at this time, but is interested in reviewing any proposals for EFH area modifications or HAPC designations in this region.

A decision was made early on to focus on modifications to EFH measures that regulated bottom trawling only, such as EFH Conservation Areas that prohibit bottom trawl gear and the 700 fathom Footprint Closure. This limited discussions to use of bottom trawl gear only, and therefore did not address other bottom contact gear use. Use of bottom tending gear in sensitive habitats can have adverse impacts, but this is not always the case (e.g., National Research Council 2002; Lindholm et al. 2013). The 2008 MBNMS Management Plan includes an action plan “Bottom Trawling Effects on Benthic Habitat.” which has the goal to maintain the natural biological communities and ecological processes in MBNMS by evaluating and minimizing adverse impacts of bottom trawling in benthic habitats while allowing the long-term continuation of sustainable local fisheries in the sanctuary. The collaborative EFH proposal addresses several of the specific strategies in the action plan, including: develop partnerships with fishermen; assess trawl activity; identify habitats vulnerable to trawling; and, identify and implement potential ecosystem protection measures.

Throughout the proposal development process, clear and transparent communication was employed to facilitate collaborative decision-making. Each member of the group had input on the proposed modifications to EFH Conservation Areas and the sanctuary technical team supported the process with spatial mapping products and tools, data analyses and interpretation (e.g., www.sanctuarysimon.org/maps/sesa).

The proposed boundary modifications of Areas 1 through 13 described in Figure 1 are a result of the collaborative stakeholder process, and represent a package of areas that if taken collectively provide increased protection to rocky reef HAPCs and sensitive biogenic species, including corals and sponges, as well as provide increased access to valuable fishing grounds. The package includes a total of 15 areas,

comprising ten additions to EFH Conservation Areas that add 259.6 square statute miles of benthic habitat that prohibit bottom trawl gear, and 5 modifications to existing EFH Conservation Areas that prohibit bottom trawl gear that re-open 153.3 square statute miles of benthic habitat to bottom trawling.

All parties achieved consensus on areas 1 through 13, however, two of the areas in the sanctuary (14 and 15 in region South of 36 degrees N) were negotiated without the participation of Oceana, Ocean Conservancy, and Natural Resources Defense Council. At the end of the stakeholder process, MBNMS finalized the design of these two areas with the California Risk Pool as the full group did not have the time or opportunity to reach consensus on these areas.

In addition, this proposal identifies and proposes two “voluntary management areas” that will not be affected by EFH regulation, yet will be recognized as areas to be avoided by trawlers due to sensitive habitat. One additional voluntary area is included in the vicinity of areas 14 and 15, which was developed by MBNMS and fishing stakeholders and again was not approved by all stakeholders. These areas have specific latitude and longitude coordinates that can be plotted by navigational software so that the fishermen can detect and avoid the areas. The details on how long the voluntary measures will be in place, and the timescale for revisiting the agreement will be worked out by the group in the next 2-3 months. These areas are non-regulatory, will be managed and monitored by the sanctuary, and should be considered as experimental or as pilot areas to test the effectiveness of the concept of voluntary management areas for habitat protection.

In summary, the array of proposed modifications to EFH designations will demonstrate a net habitat benefit to groundfish EFH, by:

- further minimizing adverse impacts of bottom trawl fishing to groundfish EFH to the extent practicable, based on new and newly-available information;
- providing socioeconomic benefits at both the fishery and community scale;
- increasing access of bottom trawl fishing activity to historically productive trawl fishing grounds in MBNMS that currently prohibit bottom trawl activity, while minimizing adverse impacts to EFH groundfish on a whole. The re-opening comes in the context of an overall package of revisions that will yield a strong net increase in habitat protection; and
- increasing the overall protection of rocky reef (HAPC) and other hard substrate, biogenic habitats (e.g., corals, sponges, and other), canyon habitat, as well as soft substrate habitat, at various depths (see Table 2).

Table 2: Summary Statistics for Area, Habitat and Biogenic Observations

Proposed Modifications	Total Area (sq st mi)	Area of Habitat Type (sq st mi)		Proportion of Habitat Type		# Biogenic Observations (DSCRPT database)		
		hard bottom	soft bottom	hard bottom	soft bottom	Corals	Pennatulids	Sponges
Additions to EFH	259.6	42.1	217.5	16.2%	83.8%	397	382	50
Re-opening EFH	153.3	0.6	152.7	0.4%	99.6%	2	12	0
Net Change	106.3	41.5	64.8	39%	61%	395	370	50

3B. CONSISTENCY WITH COUNCIL RESPONSIBILITY

The proposal provides information that the Council can use to better account for the function of Pacific Coast Groundfish Essential Fish Habitat (EFH) when making fishery management decisions. The Council is responsible for minimizing adverse effects to the extent practicable from fishing on groundfish EFH and, within that broader definition, to protect habitat areas of particular concern, which the proposed options are designed to accomplish. The Council is also responsible for reviewing the best available science to determine whether protection of a particular area is warranted and assessing the potential socio-economic effects on the fisheries that may be affected by any proposal; these items are also taken into account by the proposal to be consistent with the Council's goals, objectives and guidelines.

The proposal is consistent with the MSA, the principal statutory basis for fishery management within the Exclusive Economic Zone. Information presented is consistent with the January 2002 National Marine Fisheries Service (NMFS) rule that established guidelines to assist the Regional Fishery Management Councils and the Secretary of Commerce in the description and identification of EFH in fishery management plans, the identification of adverse effects to EFH, and the identification of actions required to conserve and enhance EFH.

The primary source of data utilized in this proposal comes from the EFH Phase 1 Report and the Groundfish EFH Synthesis Report. We also included additional new data from the Monterey Bay Aquarium Research Institute's (MBARI) Video Annotation and Reference System (VARS) database, and some groundfish and biogenic data from the California State University Monterey Bay's 2007-2012 Deepwater Characterization Remotely Operated Vessel (ROV) surveys, which is a partnership project between MBNMS and CSUMB's Institute for Applied Marine Ecology (See Appendix C). This proposal

also utilizes local knowledge and information from fishermen that is at a more refined scale than the data provided in the EFH Phase I Report and NMFS Synthesis, due to confidentiality of data.

3C. OVERVIEW OF NEW INFORMATION

The primary source of new information utilized in this proposal comes from the Groundfish EFH Phase 1 Report and Synthesis Report. Specifically, we have used:

- Improved data on the location of rocky reef (HAPC) and the distribution of seafloor habitat types both inside and outside of EFH Conservation Areas.
- The DSC RTP database of observations of corals, sponges and pennatulids, which represents a major advancement in availability of these records of coral and sponge presence in the region and that was not available during the Amendment 19 process.
- The newly available groundfish species habitat occurrence and abundance models for six species modeled by NWFSC and 12 species modeled by NCCOS.
- NMFS bottom trawl survey effort

We augmented the information presented in this proposal with site specific visual observation data of seafloor habitats in MBNMS when available. This additional new data includes (see Appendix C for more detailed information):

- Observations from the Monterey Bay Aquarium Research Institute's (MBARI) Video Annotation and Reference System (VARS) database of 12 groundfish species in the MBNMS study area. The species were selected based on the species modeled by NWFSC and NCCOS and the observations were mapped and compared to the species habitat occurrence model predictions (see maps in Appendix #)
- Visual observations of rocky habitat, biogenic habitat, and managed groundfish from the California State University Monterey Bay's 2007-2012 Deepwater Characterization surveys. These surveys are part of a partnership project between MBNMS and CSUMB's Institute for Applied Marine Ecology (IfAME & MBNMS 2011).

Lastly, this proposal also utilizes local knowledge and information from fishermen that is at a more refined scale than the data provided in the EFH Phase I Report and NMFS Synthesis Report, due to confidentiality of data. The trawl fishermen have provided very site specific 'socioeconomic' information on location of historically productive bottom trawl fishing grounds and operational logistics that aid in an economically viable fishery in the area. (See 5e in each area description).

Additional new information presented in the Phase 1 Report and EFH Synthesis Report, not summarized here, is covered in the Discussion section of this proposal.

4. PROPOSED ACTIONS

The following are proposed actions for Council consideration. The stakeholders request that the Council consider the proposed modifications as a comprehensive package, as the array of management measures was the end result of in-depth analysis and discussion between all stakeholders. The only exception to this request is that we offer options for designating two areas as HAPC “Areas of Interest”.

4A. SPATIAL CHANGES

This proposal includes the following requests to modify or maintain the spatial designations of groundfish EFH provisions to minimize, to the extent practicable, the adverse effects of bottom trawl gear on groundfish EFH within:

ECOLOGICALLY IMPORTANT HABITAT CLOSED AREAS:

- i. **EFH Conservation Area Expansions and New Designations:** Propose to expand seven EFH Conservation Areas(also known as ecologically important habitat closed areas) and designate three new EFH Conservation Area as follows: Area 1: expand the boundaries of the existing Monterey Bay/Canyon Conservation Area by adding the Ascension and Año Nuevo Canyon Complex; Area 2: propose designating South of Davenport a new EFH Conservation Area; Area 4: expand the boundaries of the existing Monterey Bay/Canyon Conservation Area by adding the Outer Soquel Canyon area; Area 5: expand the boundaries of the existing Monterey Bay/Canyon Conservation Area by adding an area southwest of Smooth Ridge; Area 8: expand the boundaries of the existing the Point Sur Deep Conservation Area by adding an area west of Sobranes Point; Area 10: expand the boundaries of the Big Sur Coast/Port San Luis Conservation Area by adding the area south of Surveyors Knoll ; Area 12: expand the northern portion of Big Sur Coast/Port San Luis Conservation Area by adding a portion of the Point Sur Platform; Area 13: expand the southern boundary of the Big Sur Coast/Port San Luis Conservation Area by adding an area between Partington Point and Lopez Point; Area 14: propose designating La Cruz Canyon a new EFH Conservation Area; and Area 15: propose designating West of Piedras Blancas SMCA a new EFH Conservation Area.
- ii. **EFH Conservation Areas Re-openings:** Propose to eliminate 5 sections that are part of existing EFH Conservation Areas. The areas include: Area 3: re-open a section of Monterey Bay/Canyon Conservation Area near the Lower Portion of Cabrillo Canyon; Area 6: re-open a section of Monterey Bay/Canyon Conservation Area south of the MARS Cable; Area 7: re-open a section of Monterey Bay/Canyon Conservation Area west of Carmel Canyon; Area 9: re-open a section of Pt Sur Deep Conservation Area east of Sur Ridge; and Area 11: re-open a section of Big Sur Coast/Port San Luis Conservation Area near the Sur Canyon Slot Canyons.
- iii. **Status Quo for Davidson Seamount:** Request no changes to the boundaries of the Davidson Seamount Conservation Area, which prohibits all bottom contact gear, or any other gear that is deployed deeper than 500 fathoms in the Davidson Seamount Management Zone of the MBNMS (Figure 3).

HAPC DESIGNATION OPTIONS: (Figure 2)

The proposed options are consistent with the MSA, the principal statutory basis for fishery management within the Exclusive Economic Zone. As per the MSA, habitat areas of particular concern (HAPC) are types of areas of habitat with EFH that are identified based on one or more of the following considerations: the importance of the ecological function provided by the habitat; the extent to which the habitat is sensitive to human-induced environmental degradation; whether, and to what extent development activities are or will be stressing the habitat type; and the rarity of the habitat type. The Groundfish FMP currently identifies the following habitat types as HAPC: estuaries, canopy kelp, seagrass, and rocky reefs. In addition the FMP identifies specific areas as HAPC, called “Areas of Interest”, which are a variety of submarine features, such as banks, seamounts, and canyons. Two rocky banks, Point Sur Platform and La Cruz Canyon, have been delineated in MBNMS based on NMFS survey data and ROV observations of deep sea corals and sponges collected in 2007 to 2012. The Point Sur Platform rocky reef is based on United States Geological Survey (USGS) 2000 substrate data from acoustic imagery and the La Cruz Canyon rocky reef is based on Moss Landing Marine Labs seafloor mapping data from 2003 (geohab_ca in EFH catalog). MBNMS is proposing that these areas be added as “areas of interest” for HAPC designation, because they contain features and habitat types consistent with existing HAPC designations.

HAPC Option 1) Propose Council consideration of new EFH HAPCs “Areas of Interest” at Point Sur Platform (see Figure 2)

HAPC Option 2) Propose Council consideration of new EFH HAPCs “Areas of Interest” at La Cruz Canyon (See *Section 6-Discussion* for more information.) (see Figure 2)

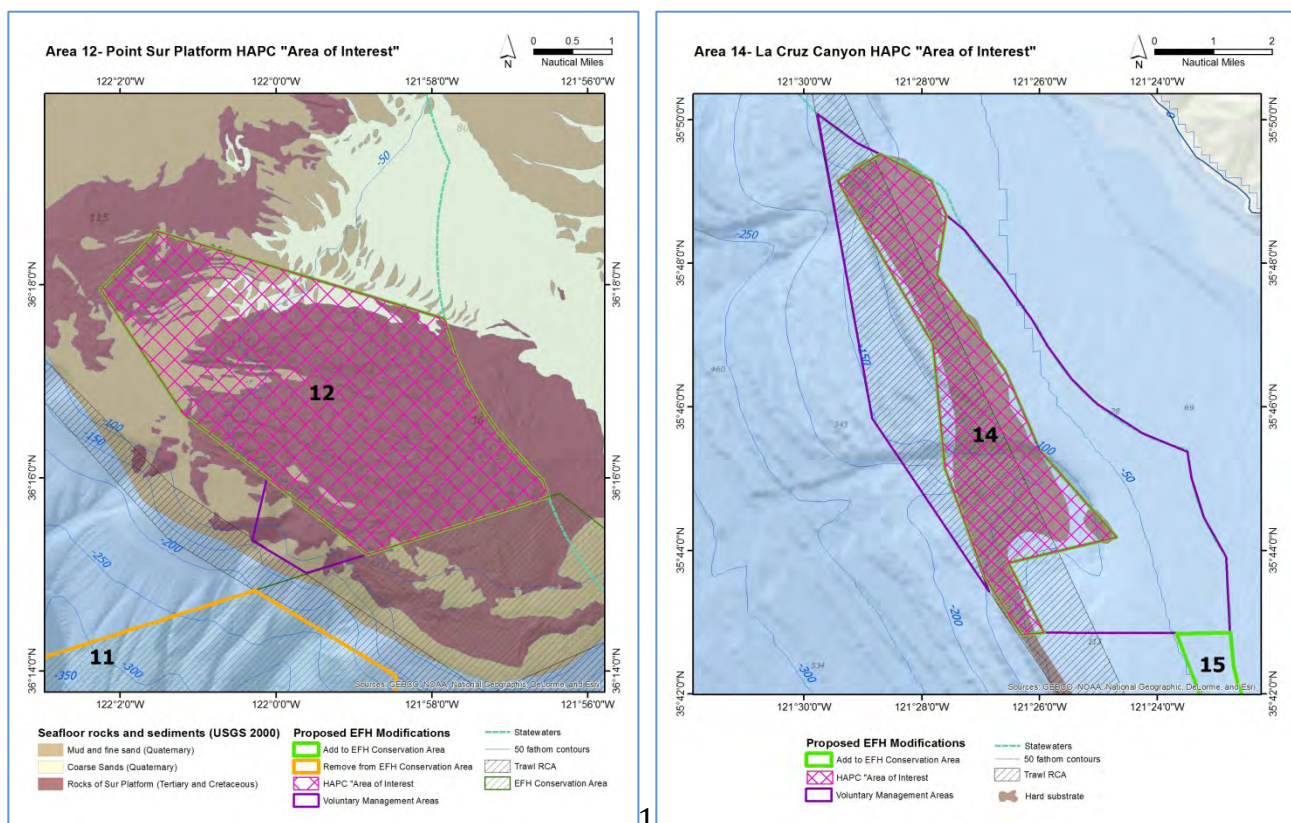

Figure 2: Proposed new HAPCs at Point Sur Platform and La Cruz Canyon

4B. GEAR REGULATION CHANGES

- i. Propose to prohibit bottom trawl gear (as defined in 50 CFR § 660.302) other than demersal seine in the newly proposed EFH Conservation Areas as described in 4a(i) of this proposal
- ii. Propose to lift the restriction on bottom trawl gear (as defined in 50 CFR § 660.302) other than demersal seine, at those areas that are part of existing EFH Conservation Areas as described in 4a(ii) of this proposal.

4C. CHANGES TO THE DESCRIPTION AND IDENTIFICATION OF GROUND FISH EFH AND ITS COMPONENTS.

As indicated above, the areas described in our proposal are proposed to be designated as EFH Conservation Areas, and designation of HAPC ‘Areas of Interest’ for Area 12, Pt. Sur Platform and Area 14, La Cruz Canyon.

4D. OTHER CHANGES

- i. As a result of the collaborative nature of the stakeholder discussions, the group proposes a new spatial management concept - Voluntary Management Areas - which will be adopted by fishermen as voluntary no bottom trawl areas. Three areas are identified: South of Davenport Area 2, South of Pt Sur Platform Area 12 and East and West of La Cruz Canyon Area 14. These areas will be non-regulatory, and were developed as an experimental, pilot approach to test the effectiveness of this tool to protect small areas of important habitat where there is fishing community concern about small EFH areas that may be challenging to navigate.
- ii. The group also proposed that as part of the revised EFH regulations, a new enforcement regime be implemented to include:
 - Changing VMS ping rates from 1 hour to 15 minute intervals to more precisely indicate the location of the vessel track while fishing is occurring
 - Requiring the use of hydraulic sensors to determine precisely when trawl nets are retrieved and deployed;
 - Requiring depth sensors to record the active fishing depth of the trawl net in relation to the seafloor; and
 - Requiring the recording and reporting of these sensory data by means of an electronic log book.

5. RELEVANT AND APPLICABLE CHARACTERISTICS INFORMATION

5A.B. & E. BIOLOGICAL, GEOLOGICAL & SOCIOECONOMIC CHARACTERISTICS – ALL AREAS COMBINED

This section looks at the proposal as a complete package and provides a summary of the biological, geological, and socioeconomic data for all proposed areas combined. The summary data demonstrates a net increase in conservation benefits for all benthic habitats (rocky habitat, canyon, and soft-bottom), biogenic organisms and groundfish, as well as an economic benefit for the local bottom trawl fishery.

BIOLOGICAL CHARACTERISTICS (ALL AREAS COMBINED)

Biogenic Components

There are a total number of 60,166 observations of corals, pennatulids, and sponges within the MBNMS study area in the DSCRPT database (Figure 3, Table 3). If we consider only corals and sponges (not including pennatulids) within the study area, 25,775 are inside current EFH conservation areas, leaving the remaining 1,875 outside EFH conservation areas. **This proposal includes an additional 445 observations of corals and sponges in new or expanded groundfish EFH Conservation Areas** (Table 3).

Table 3: Number of observations of corals, pennatulids (sea pens) and sponges in the DSCRPT database in the MBNMS study areas. Also provided are the number of observations that are inside and outside the boundaries of the current EFH Bottom Trawl Conservation Areas based on proposed changes.

Taxonomic Group	Total Observations in MBNMS Study Area	Status Quo		Proposed Changes		
		# Inside EFH Conservation Areas	# Outside EFH Conservation Areas	# Add to EFH	# Reopen Areas	Net Change
Corals	27458	25705	1753	397	2	+395
Pennatulids	32516	10959	21557	382	12	+370
Sponges	192	70	122	50	0	+50
Grand Total	60166	36734	23432	829	14	+815

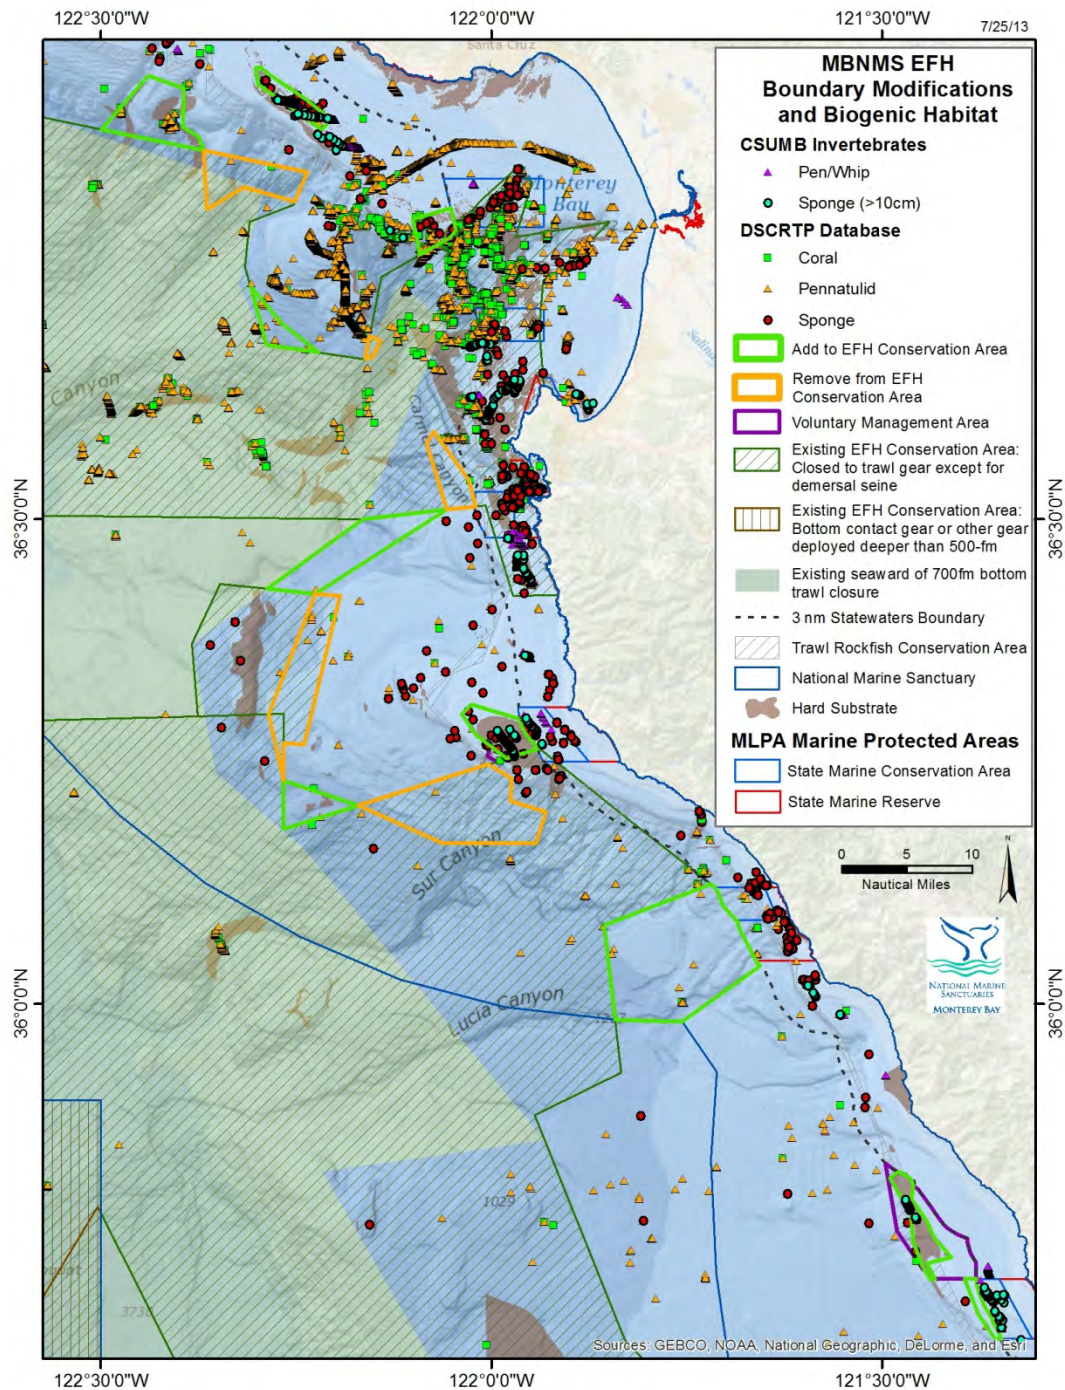

Figure 3: Location of observations of corals, sponges, and pennatulids from the DSCRTP database and CSUMB visual surveys in the MBNMS study area. See Appendix C for more information about CSUMB visual survey data.

In addition to the observations in the DSCRPT database, additional visual surveys by CSUMB in Areas 2, 12, and 14 indicates that the proposed actions would include an additional 636 sponge and 160 pennatulid observations **in new or expanded groundfish EFH Conservation Areas.** (Table 4).

Table 4: Number of observations of pennatulids (sea pens/sea whips) and sponges by CSUMB visual surveys in proposed areas 2, 12, and 14.

Taxonomic Group	Number Observations			
	Area 2	Area 12	Area 14	Total
Pennatulids	157	0	3	160
Sponges (>10 cm)	31	239	366	636
Total	188	239	369	796

Groundfish Components

Comparison of the maps of the NWFSC and NCCOS species habitat occurrence models with the locations of the 15 proposed areas (see maps in Appendix B) indicates that each of the 15 areas provide some amount of high suitability habitat for one or more of the six focal species. Using the output of the NWFSC models, we determined the number of high probability of occurrence cells that overlap with each of the proposed area for each of the focal species (Table 5).

Based on this analysis, some areas with a high probability of occurrence of the focal species are being proposed for re-opening to the bottom trawl fishery, particularly areas highly suitable for sablefish and longspine thornyhead. These species are part of the deep slope groundfish complex that is targeted by the commercial trawl fleet and the trawl fishermen indicated that those areas would be important to their economic sustainability.

However, for each focal species more cells with a high probability of occurrence are proposed for inclusion in new or expanded groundfish EFH bottom trawl conservation areas. In addition, in-situ observations by MBARI and CSUMB of the groundfish species included in the NWFSC and NCCOS models indicate that many species of groundfish have been observed in many of the areas proposed for addition to EFH Conservation Areas (Table 6). It is important to note that survey effort was highly variable in the areas shown in Table 6 and the observations provide information on presence, but not absence or relative abundance of groundfish in the areas. Very little survey effort took place in the areas proposed for removal from EFH Conservation Areas.

Table 5: Number of high probability of occurrence cells from NWFSC species habitat occurrence models in proposed areas. The high probability of occurrence threshold for the three abundant focal species (sablefish, longspine thornyhead and Petrale sole) was set at a probability of occurrence ≥ 0.25 . These thresholds are based on EFH Synthesis Report although it acknowledges that the cutoff is a subjective exercise (p.42). The counts represent part or all of a cell within the focal area. (*=count of 2by2km cell ≥ 0.50 , **=count of 2by2km cell ≥ 0.25). Green font indicates areas proposed for addition and orange font.

	Number of High Probability of Occurrence Cells															Total # Add to EHF	Total # Reopen EFH	Net Change
	Area 1	Area 2	Area 3	Area 4	Area 5	Area 6	Area 7	Area 8	Area 9	Area 10	Area 11	Area 12	Area 13	Area 14	Area 15

SPATIAL AND GEOLOGICAL CHARACTERISTICS (ALL AREAS COMBINED)

The MBNMS study area includes 6157.6 sq st miles. Based on the substrate data layers in the EFH Phase 1 Report (shown in Figure 4), 93.2% of the MBNMS study area is soft bottom and 6.8% is rocky habitat (Table 7). Currently, a total of 4,103 sq st miles are included in a combination of EFH Conservation Areas and the EFH 700 fm Trawl footprint closure. Given the changes to EFH Bottom Trawl Conservation Areas in this proposal - the addition of 259.6 sq st miles in 10 areas and the elimination of 153.3 sq st miles in 5 areas – that total area would increase to 4,209.3 sq st miles. **This is a net addition of 106.3 sq st miles, of which 41.5 sq st miles is rocky habitat (an HAPC) (Table 2).**

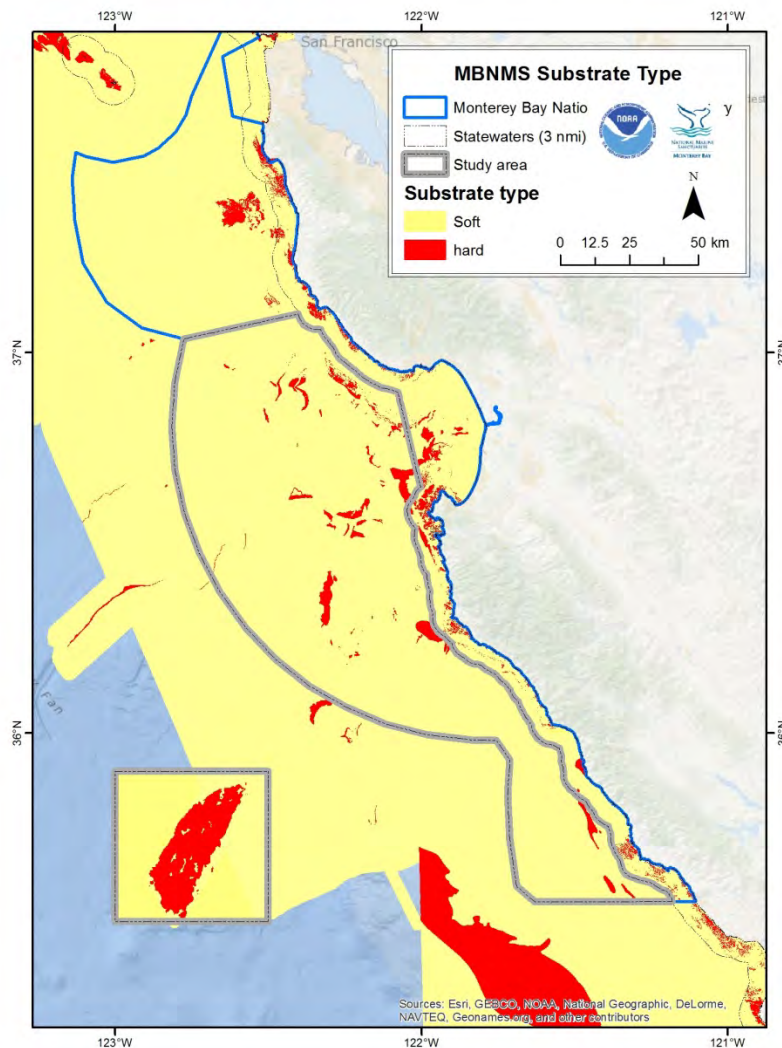

Figure 4: Substrate type in and around MBNMS.

Table 7: Hard and soft substrate within MBNMS.

Substrate	Area of MBNMS (sq statute mi)	Percentage of MBNMS
hard	419.2	6.8%
Soft	5738.4	93.2%
Grand Total	6157.6	100%

Based on video observations at Pt. Sur Platform, the amount of hard bottom may be underestimated in some places by the NMFS data layer (see USCG 2000 data discussed in Appendix C). Thus the area of 42 sq st miles is likely a minimum estimate of rocky habitat proposed for inclusion in new or expanded EFH Conservation Areas. Also, note that only a very small amount of approximated hard bottom, 0.44 and 0.12 sq st miles within Areas 3 and 11, is inside areas proposed for re-opening to the groundfish bottom trawl fishery (Table 2 and Table 8).

Table 8: The total area encompassed by each of the areas proposed for addition or removal (grey filled rows) from groundfish EFH bottom trawl conservation areas. Area of hard and soft bottom habitat, as well as the proportion of the area by habitat type, is also provided.

Proposed Area	Total Area (sq st mi)	Area (sq st mi)		Proportion of Area	
		Hard Bottom	Soft Bottom	Hard Bottom	Soft Bottom
1	30.43	8.40	22.03	27.6%	72.4%
2	9.78	5.19	4.59	53.1%	46.9%
3	26.88	0.44	26.44	1.6%	98.4%
4	9.70	3.78	5.92	38.9%	61.1%
5	9.51	0	9.51	0%	100%
6	1.46	0	1.46	0%	100%
7	14.27	0	14.27	0%	100%
8	37.56	0	37.56	0%	100%

Proposed Area	Total Area (sq st mi)	Area (sq st mi)		Proportion of Area	
		Hard Bottom	Soft Bottom	Hard Bottom	Soft Bottom
9	42.12	0	42.12	0%	100%
10	14.33	1.17	13.16	8.2%	91.8%
11	68.59	0.12	68.47	0.2%	99.8%
12	16.61	12.40	4.21	74.6%	25.4%
13	113.80	0	113.80	0%	100%
14	13.41	11.16	2.25	83.2%	16.8%
15	4.48	0	4.48	0%	100%

This proposal aims to increase the amount of canyon habitats in MBNMS that is protected from bottom trawling. We have identified 69.2 sq st miles for inclusion in EFH Conservation Areas, 20% of which is hard bottom canyon habitat (Table 9). We have identified 37.9 sq st miles of canyon habitat to re-open for the groundfish bottom trawl fishery, comprised almost entirely of soft bottom canyon habitat (0.4 sq st miles of hard bottom canyon habitat). The net outcome of the proposal is a net increase in the amount of canyon habitat in EFH Bottom Trawl Conservation Areas of 31.3 sq st miles (Table 9).

Table 9: Total area (square statute miles) by habitat type (depth zone, substrate, canyon) for each type of proposed EFH modification For the SESA process, we developed a finescale subdivision of depth zone and this table shows the breakdown by depth for the different habitats.

Habitat Category (MBNMS SESA habitat categories)			Area (sq st mi)	
Depth Zones	Substrate Type	Canyon	Add to EFH CAs	Re-open EFH CAs
Shelf (30 - 100 m)	Hard bottom	No	16.2	0
	Soft bottom	No	9.3	0
Shelf Break (100 - 300 m)	Hard bottom	No	10.7	0

Habitat Category (MBNMS SESA habitat categories)			Area (sq st mi)	
Depth Zones	Substrate Type	Canyon	Add to EFH CAs	Re-open EFH CAs
	Soft bottom	Yes	3.6	0
		No	7.1	0.01
		Yes	1.5	0
Slope 1 (300 - 800 m)	Hard bottom	No	0.03	0.1
		Yes	3.4	0
	Soft bottom	No	31.2	33.9
		Yes	15.8	8.3
Slope 2 (800 - 3000 m)	Hard bottom	No	1.2	0
		Yes	7.0	0.4
	Soft bottom	No	114.8	81.3
		Yes	37.8	29.1

Figure 5: Area of hard bottom and soft bottom added and removed from existing EFH CAs.

5C.D. PHYSICAL OCEANOGRAPHIC AND CHEMICAL CHARACTERISTICS (ALL AREAS COMBINED)

Information on the physical oceanographic and chemical characteristics is incorporated by reference to the EFH Synthesis Report. In summary, the oceanographic and chemical characteristics in the proposed areas are consistent with the Central Biogeographic Region.

5E. SOCIOECONOMIC CHARACTERISTICS (ALL AREAS COMBINED)

Fishing is a part of the Central coast's region history, culture and economy. With more than 500 commercial vessels and numerous recreational fishers, fishing in the region annually takes about 200 species, with the bulk of the commercial landings composed of squid, rockfishes, salmon, albacore, Dover sole, sablefish, mackerel, anchovy, and sardines. The five primary gear types used are pots and traps, trawl nets, hook-and-line gear, purse seines, and gill nets. In 2007, 560 fishing vessels made commercial landings at the five main ports in or adjacent to the Monterey Bay National Marine Sanctuary: Princeton/Half Moon Bay, Santa Cruz, Moss Landing, Monterey, or Morro Bay (CDFW).

The only fishery that may be affected by this proposal is the groundfish trawl fishery. One of the most important aspects about the development of this proposal is the high level of involvement and input the groundfish trawl fleet had on the designs to add or remove areas from EFH Conservation Areas. The stakeholder group included five active trawl fishermen, the commercial fishing representatives from the Monterey Bay Sanctuary Advisory Council, and a coalition of groups that form the California Risk Pool (The Nature Conservancy, Fort Bragg Groundfish Association, Half Moon Bay Groundfish Marketing Association, and Central California Seafood Marketing Association). In addition, MBNMS staff met with trawl fishermen in Fort Bragg that had historically fished in the Sanctuary, and with fishermen Half Moon Bay who currently fish in the region of Año Nuevo. All of the fishermen's input and comments were considered as the area designs moved forward. The trawl fishermen were able to provide specifics on the location of trawl tows based on their navigational records, and detail on the trawl paths, which are normally curved to follow a particular contour line and avoid high relief geologic features or "snags". The group also discussed the current state of the trawl fleet, which has steadily declined in numbers to less than a dozen in California, with approximately five actively operating in the MBNMS.

If this proposal is accepted, a total of 153 square statute miles will be re-opened to the commercial groundfish trawl fleet, and the specific areas are key to providing a diverse portfolio of species both seasonally and geographically. The areas to be re-opened are economically important to the fishermen, and represent historically fished areas that are key to providing sustainable, viable trawl fisheries in the Monterey Bay Sanctuary. Some of the areas such as the Pt Sur Region were developed as a package and the proximity to Monterey Harbor makes these accessible and economically viable for the Monterey trawl fleet. Other areas such as Davenport are also highly productive fishing grounds as well and can be accessed from any port in Monterey Bay, as well as Half Moon Bay port. Approximately, 3.7% of all existing EFH Conservation areas are proposed to be re-opened, which is a relatively small percentage, and yet the areas are important for sustaining the five active trawlers in the MBNMS.

It's important to note that the group developed some additional management measures to help mitigate additional pressures on Industry. Please see the discussion section on Voluntary Management Areas and Changes to Enforcement of Spatial Areas for more information.

Lastly, we understand that as part of the Council's National Environmental Policy Act process in Phase Three, any fishery related socioeconomic impacts will be looked at through that comprehensive analysis.

5A.B.E., BIOLOGICAL , GEOLOGICAL & SOCIOECONOMIC CHARACTERISTICS BY AREA

The biological, geological and socioeconomic characteristics will be described in each the 15 proposed areas, from 1 to 15. It includes photos of featured habitat in each area (if available), a summary of the spatial and geologic characteristics, observed biogenic habitat and groundfish observations, as well as a description of any affects to fishing as relayed by the trawl fishermen. Maps for each of the spatial areas can be found in Appendix A with respective coordinates for latitude and longitude in Appendix E.

AREA 1 - EXPANSION OF THE MONTEREY BAY/CANYON CONSERVATION AREA TO INCLUDE THE AÑO NUEVO AND ASCENSION CANYON COMPLEX

	
<p>Año Nuevo Ascension Canyon Complex; Image from July 2013 CSUMB cruise</p>	<p>Bubblegum coral (<i>Paragorgia</i>) in lower left; Image from 2008 MBARI cruise</p>

5a. Biological Characteristics

Biogenic Components

A small portion of the seafloor in Año Nuevo Canyon and Ascension Canyon has been surveyed by an MBARI ROV (Appendix A, Area 1). The DSCRTP database contains 161 observations of hard-substrate associated corals - including bamboo, bubblegum, and mushroom soft corals - and 105 observations of soft-bottom associated sea pens and sea whips from these ROV surveys (Table 10). CSUMB just completed a 2013 deep water characterization cruise in July, and the summary data is not yet available, yet some images are available such as the sponge shown above left. Prohibiting bottom trawling in this area would protect these biogenic species that are highly vulnerable to, and slow to recover from, impacts from bottom trawling.

Table 10: Area 1: Observed Corals & Pennatulids (DSCRPT database).

Ascension and Año Nuevo canyon Complex	Common Name	Group	Count
<i>Alcyonacea</i>	Soft coral	Soft coral	1
<i>Anthomastus ritteri</i>	Mushroom soft coral	Soft Coral	16
<i>Euplexaura sp.</i>	Soft coral	Soft coral	3
<i>Funiculina sp.</i>	Sea Pen	Octocorals	27
<i>Isididae</i>	Bamboo coral	Octocorals	106
<i>Paragorgia sp.</i>	Bubblegum coral	Soft Coral	30
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	32
<i>Swiftia sp.</i>	Soft coral	Soft coral	5
<i>Umbellula lindahli</i>	Sea Pen	Octocorals	46
Grand Total			266

Groundfish Components

The high habitat diversity in Area 1 provides habitat for a diversity of managed groundfish species. The NWFSC occurrence models predict that Area 1 contains high probability habitat for 3 species: sablefish, longspine thornyhead, and a small area of high probability habitat in the northern part of Area 1 for greenstriped rockfish (Table 5; for Figures see Appendix B). Consistent with these model predictions, sablefish and thornyhead had been observed during ROV surveys in Area 1 (Table 11). Dover sole have also been observed in this area (Table 11) by MBARI, which is consistent with the predictions of the NCCOS occurrence model of high probability of Dover sole in Area 1.

Table 11: Area 1: MBARI groundfish observations (VARs data query by Linda Kuhn 7/18/13)

		Area 1
Scientific Name	Common Name	Ascension and Año Nuevo canyon complex
<i>Anoplopoma fimbria</i>	Sablefish	7
<i>Microstomus pacificus</i>	Dover Sole	16
<i>Sebastolobus</i>	Longspine and Shortspine Thornyhead guild	260
<i>Sebastolobus altivelis</i>	Longspine Thornyhead	36
Grand Total		319

5b. Spatial and Geological Characteristics

The proposed area extends the northern boundary of the EFH Monterey Canyon Area of Interest to include an additional 30.43 sq st miles of the Año Nuevo and Ascension Canyon complex (Appendix A, Area 1). Area 1 has high habitat richness (6 habitat categories) and diversity ($H' = 4.05$) due to a mix of hard and soft substrate and a wide depth range (322-1600 m) inside and outside of submarine canyons. Hard substrate, located primarily along the canyon walls, is approximated to cover 27.6% of Area 1 (Table 8). Adding Area 1 to the EFH bottom trawl closed areas would increase protection of hard substrate by 8.40 sq st miles (Table 7). This area is also included into SESA 4, which was identified by the Sanctuary as a location of unique, rare, or important benthic habitat.

5e. Socioeconomic Characteristics

Area 1 is an area of relatively low historic and current trawling activity and due to the abundance of rocky reef HAPC and biogenic habitat vulnerable to impacts from trawling, the fishing representatives agreed that this area should be protected through inclusion into an EFH conservation area. Current trawling operations in this region focus mainly on the shelf, specifically the seaward and shoreward sides of the Trawl Rockfish Conservation Area (RCA) where they target petrale sole, English sole and black cod (sablefish). Scottish seine is used on the upper northwest corner of the canyon. The canyon heads provide a widow rockfish fishery, which is an important fishery to the trawlers as this is one of only two areas within reach from Monterey Harbor where they have a high probability of catching this important species. The design of the Area 1 modifications considers, to the extent practicable to groundfish EFH, high value areas to the fishermen.

AREA 2 – ADD NEW CONSERVATION AREA – “SOUTH OF DAVENPORT”

	
Brittle stars near low lying rock outcrops	Mushroom soft corals (<i>Anthomastus ritteri</i>) on the right

5a. Biological Characteristics***Biogenic Components***

Area 2 has been surveyed by NMFS (Appendix A). The DSCRTP database contains 13 observations of hard-substrate associated corals, 25 sponges, and 17 observations of soft-bottom associated pennatulids in from these ROV surveys (Table 12). Brachiopod beds have also been observed in this area. Surveys to characterize benthic habitats and communities (using camera sled, submersibles, and ROVs) have occurred on the shelf and shelf break ([see SIMoN webpage](#)).

Table 12: Area 2: Observed Corals, Sponges & Pennatulids (DSCRPT database).

South of Davenport	Common Name	Group	Count
<i>Anthozoa</i>	Coral	Coral	13
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	17
<i>Porifera</i>	Sponge	Sponge	25
Grand Total			55

Table 13: Area 2: CSUMB Observed Invertebrates (2007-2012)

South of Davenport	Common Name	Group	Count
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	157
<i>Porifera</i>	Sponge (>10 cm)	Sponge (>10 cm)	31
Grand Total			188

Groundfish Components

The NWFSC occurrence models predict that Area 2 contains high probability habitat for 4 species: petrale sole, yelloweye and greenstriped rockfish (Table 5). The high probability habitat for abundant focal species (petrale sole) was selected as the probability of occurrence ≥ 0.50 and high probability of occurrence for less abundant focal species (yelloweye and greenstriped) was identified as the probability of occurrence ≥ 0.25 (based on cutoffs in EFH Synthesis Report p.42).

Table 14: Area 2: CSUMB Groundfish Observations 2007-2012

		Area2
Scientific Name	Common Name	<i>South of Davenport</i>
<i>Canary/Vermilion/Yelloweye complex</i>	Canary/Vermilion/Yelloweye complex	3
<i>Sebastes elongatus</i>	Greenstriped Rockfish	4
<i>Ophiodon elongatus</i>	Lingcod	4
<i>Young of Year (YOY)</i>	Rockfish <5cm (usually in a school)	30
Grand Total		41

Area 2 overlaps substantially with the survey area of a recent study, which estimated the relative abundance of habitats on the shelf (65-110 m) and examined demersal fish species composition, diversity, density, and sizes relative to these habitats (Laidig et al. 2009). A total of 62 fish taxa were observed, including many groundfish FMP species. Different fish assemblages were found to characterize mud, boulder, and brachiopod habitats. An abundance of immature fishes were observed which may indicate that this area of the shelf is a nursery for younger fishes (see Section 6. Discussion for more information about potentially important juvenile habitat).

5b. Spatial and Geographical Characteristics

This area is proposed as an additional EFH Conservation Area that is located between the state water line and the RCA off South of Davenport, CA. It would add 9.78 sq st miles to EFH and is located on the shelf in a relatively shallow depth range (88-107 m). The area contains a mixture of hard (53%) and soft bottom on the outer shelf and shelf break off Davenport and the head of Cabrillo Canyon (south central portion). This area has a relatively low habitat richness (4 habitats) and habitat diversity (index = 1.0). This southern end of this area is included into SESA 5, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

5e. Socioeconomic Characteristics

This is an active trawl fishing ground for fishermen in Monterey Bay and Half Moon Bay. However, this area as designed will not affect their key trawl paths. One trawl path is shoreward of the RCA and in-between the RCA and the main rocky reef feature that is captured in Area 2. The width is approximately 1.7 miles in this channel that will remain open and provide the shelf fishery needed to support the trawl fishery. Target groundfish species in this area are widow rockfish and additional shelf rockfish complex species on the seaward side. Another trawl path is on the shallower shoreward side of Area 2 and includes targets flatfish species such as dover sole and sanddab.

South of this proposed Area 2 is a small “voluntary management area” that was selected based on a small outcropping of hard substrate and the yelloweye rockfish occurrence model by NWFSC. Hundreds of pennatulids and many corals have been observed in this area from MBARI ROV dating back to 1993 and 2006. This area is not included in the EFH proposal as an EFH modification, yet based on the density of pennatulids and the location of the rocky reef, there is agreement by the fishermen to observe this as a no trawl zone.

***AREA 3 –RE-OPEN AN AREA OF THE MONTEREY BAY/CANYON CONSERVATION AREA
IN LOWER CABRILLO CANYON***

5a. Biological Characteristics

Biogenic Components

West Coast Groundfish Bottom Trawl Surveys in or near this area have collected 1 specimen of hard-substrate associated coral, *Anthomastus ritteri* (mushroom soft coral), in 2008 and 1 soft-bottom associated pennatulid in 2001 (Table 15).

Table 15: Area 3: Observed Corals & Pennatulids (DSCRPT database).

Lower Portion of Cabrillo Canyon	Common Name	Group	Count
<i>Anthomastus ritteri</i>	Mushroom soft coral	Soft Coral	1
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	1
Grand Total			2

Groundfish Components

Area 3 provides suitable habitat for the subset of managed groundfish species that are associated with soft bottom habitat on the slope and in canyons. For example, this area contains high probability habitat for sablefish and longspine thornyhead based on the NWFSC occurrence model.. The threshold of high probability habitat for abundant focal species, e.g. sablefish and longspine thornyhead was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geographical Characteristics

The proposed area alters the northern boundary of the EFH Monterey Canyon Area of Interest to remove 26.87 sq st miles over Cabrillo Canyon and the eastern wall of Año Nuevo Canyon (Table 1).

Area 3 contains slope habitat ranging in depth from 586 m to 1436 m. The seafloor in this area is approximated to be mostly soft sediment (98.4%). A small area of hard substrate (0.4 sq st miles) is located along the western wall of Cabrillo Canyon (Appendix A, Area 3).

5e. Socioeconomic Characteristics

This proposed area restores access to a historically trawled area that has been fished over multiple generations. This area provides a deep water complex fishery, which includes longspine and shortspine thornyhead rockfish, sable fish and dover sole. Trawl fishermen historically deployed their net in the

north along the south edge of Año Nuevo Canyon in Area 1 and conduct a long tow south that followed the 600 meter contour line down into Area 3. The tow would follow the contour line turning back north, and the fishermen would mid water trawl over the small hard substrate area in the canyon and continue east. Re-opening Area 3 will restore an important commercial fishing ground that was trawled quite intensively prior to the EFH designation. Also, this could be viewed as a corrective measure to more accurately reflect the seaward of 700 fathom bottom trawl footprint closure, as the true 700 fathom line dips down into the existing regulatory boundary due to trying to aid enforcement and providing a straight line of the boundary in this area. Lastly, the proximity to all three Monterey ports (Santa Cruz, Moss Landing, Monterey) as well as access from Half Moon Bay port makes this a preferred fishing ground for the existing fleet.

***AREA 4 - EXPANSION OF THE MONTEREY BAY/CANYON CONSERVATION AREA
TO INCLUDE AN AREA WEST OF SOQUEL CANYON***

	
Brachiopod bed	Greenstriped rockfish (<i>Sebastes elongates</i>) and basket star (Order <i>Phrynophiurida</i>)

5a. Biological Characteristics

Biogenic Components

NMFS groundfish trawl surveys, MBARI and CSUMB ROV surveys to characterize benthic habitats and communities (using camera sled, submersibles, and ROVs) have occurred over hard and mixed substrate in the shelf and shelf break depth zones, and in canyon habitats (e.g., canyon head, wall, and floor). There are 398 records of structure-forming invertebrates – soft corals and gorgonians, brachiopods, crinoids, stony corals, sponges, and chemosynthetic communities –from surveys.

This area is also included into SESA 6, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

Groundfish Components

The NWFSC occurrence models predict that Area 4 contains high probability habitat for 5 species: sablefish, longspine thornyhead, petrale sole, yelloweye and greenstriped rockfish (Table 5). The threshold of high probability of occurrence for abundant focal species (sablefish, longspine thornyhead and petrale sole) was selected as the probability of occurrence ≥ 0.50 and for less abundant focal species (yelloweye and greenstriped) the threshold was identified as the probability of occurrence ≥ 0.25 (based on cutoffs in EFH Synthesis Report p.42)

Grand Total		414

5b. Spatial and Geographical Characteristics

Area 4 will add 9.70 sq st miles to the Monterey Bay Canyon EFH Conservation Area (**Table 1**)

It covers a wide range of benthic habitats including a mix of hard (39%) and soft bottom in shelf, shelf break, and slope depth zones from 95 m to 1026 m. This proposed area includes the head of a small, unnamed canyon to the west of Soquel Canyon and a portion of the western wall of Monterey Canyon. This area has a high habitat diversity ($H' = 6.62$) and high habitat richness (10 habitats). The RCA bisects the middle of this proposed modification, and it is adjacent to the southeastern boundary of the Soquel Canyon SMCA.

5e. Socioeconomic Characteristics

This area currently has supports low level trawl activity, which was mitigated to the extent practicable with the design. This area is also in close proximity to several ports (Monterey, Moss Landing and Santa Cruz), and trawl fishermen currently use the areas north and east of the Area 4 boundaries to target shelf break species of rockfish and flat fish near the RCA. Since Area 4 does contain 39% hard bottom, they lay out their trawl net close to the east boundary and run further east. Alternately, they lay out north of the rocky area, and run along the shoreward side of the RCA. It's important to note for this area that the enforcement related changes (see Discussion section) are addressed and incorporated as part of this proposal process. The lack of "buffer" for the fishermen is of concern, especially in light of significant fines levied for crossing an EFH boundary.

AREA 5 - EXPANSION OF THE MONTEREY BAY/CANYON CONSERVATION AREA TO INCLUDE AN AREA SOUTHWEST OF SMOOTH RIDGE

	
Sea pen (<i>Pennatulula phosphorea californica</i>) (MBARI/NOAA)	Sea pig; crab; snail (<i>Genus Scotoplanes</i> ; <i>Family Lithodidae</i> ; <i>Genus Neptunea</i>) (MBARI/NOAA)

5a. Biological Characteristics

Biogenic Components

Survey effort for biogenic habitat has been limited in this area (Appendix A, Area 5) The DSCRTP database contains 20 records of pennatulids observed in or collected from Area 5, including members of seven different genera (Table 19). Twenty records are from West Coast Groundfish Bottom Trawl Surveys in or around this area, seven records are from ROV video surveys, and 4 records are from collected specimen (Table 20).

Grand Total			20
--------------------	--	--	-----------

Groundfish Components

The soft sediment slope habitat in this area provides suitable habitat for the subset of managed groundfish species that are associated with deeper soft bottom habitat. The NWFSC occurrence models predict that Area 5 contains high probability habitat for 2 species: sablefish and longspine thornyhead (Figure 5). The threshold of high probability of occurrence for abundant focal species (sablefish and longspine thornyhead) was selected as ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42). As mentioned above, survey effort in this area has been limited but fish from the longspine and shortspine thornyhead guild were observed by MBARI (Table 19).

Table 20: Area 5: MBARI groundfish observations (VARs data query by Linda Kuhn 7/18/13).

		Area 5
Scientific Name	Common Name	SW of Smooth Ridge
<i>Sebastolobus</i>	Longspine and Shortspine Thornyhead guild	7
Grand Total		7

5b. Spatial and Geological Characteristics

The proposed area alters the northern boundary of the EFH Monterey Bay/Canyon Conservation Area to include an additional 9.51 sq st miles of slope habitat located on the deep southwest side of Smooth Ridge (Appendix A, Area 5). Area 5 contains soft slope habitat ranging in depth from 1149 m to 1304 m. No known hard bottom habitat occurs in this area (Table 7). Area 5 overlaps with the northeast corner of SESA 9 Deep Monterey Canyon.

5e. Socioeconomic Characteristics

Area 5 is deeper than the traditional trawl path used in the past or currently. Historically, the tow followed the 650 m (355 fathom) contour, and so fishermen agree that adding this area into EFH will not interfere with that particular trawl path which will be enhanced by the proposed re-opening for Area 6. This is supported by the NMFS Fishing Effort data layer for bottom trawling for before and after.

AREA 6 – RE-OPEN AN AREA OF THE MONTEREY BAY/CANYON CONSERVATION Area
SOUTH OF THE MBARI’S MARS CABLE

5a. Biological Characteristics

Biogenic Components

No structure-forming invertebrates have been observed or collected as bycatch from this area, however there has been little to no known survey effort in this small area.

Groundfish Components

The soft bottom habitat in Area 6 provides habitat for a diversity of managed groundfish species. The NWFSC occurrence models predict that Area 6 contains high probability habitat for sablefish and longspine thornyhead (Figure 5). High probability habitat for abundant focal species (sablefish and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

The proposed area alters the northern boundary of the EFH Monterey Bay/Canyon Conservation Area to exclude 1.46 sq st miles of slope habitat located between Smooth Ridge and Monterey Canyon (Figure 1). Area 6 contains soft slope habitat ranging in depth from 1067 m to 1211 m. No known hard bottom habitat occurs in this area.

5e. Socioeconomic Characteristics

This re-open area is linked to Area 5 (SW of Smooth Ridge) as it provides a small deep area for the trawl fishermen to complete their tow and turn northwest, after they complete the tow coming south and along the north eastern border of the Smooth Ridge addition. Issues regarding enough space or “buffer” to complete a tow and retrieve the net completely were discussed as an enforcement concern to fishermen. The fishermen have expressed that a number of factors can affect control of a vessel beyond weather conditions (wind, swell, etc.) and can include mechanical situations such as engine failure, winch failure, and operator error. As a result, bottom trawl fishermen have concerns about committing a violation when they are fishing in close proximity to closed areas because they can drift into in to a closed area as a result of hanging their gear on a snag or loss of engine power. These issues are discussed in more detail in the Discussion section. In summary, this area is added “buffer” to reduce the probability of enforcement violations.

The following six areas (7,8,9,10,11 and 12) are referred to as the “Pt Sur Region” and were designed together as a region. The Pt Sur Region is a historic and vital fishing ground for the Monterey Bay trawl fleet. It also represents a crown jewel for the conservation community for diverse, biogenic habitat and associated fish species. The proximity to Monterey Port makes the region economically viable for the trawl fleet. Pt Sur Platform’s unique geologic features include a deep water canyon complex, which creates highly productive fishing grounds. The package of 6 areas, taken together, are designed to achieve three goals: protect important groundfish EFH habitat (Area 12), provide improved access to fishing for the trawl fleet (Areas 7, 9, 11), and additions for non-trawled areas into EFH (Areas 8,10).

AREA 7 – RE-OPEN AN AREA OF THE MONTEREY BAY/CANYON CONSERVATION AREA WEST OF CARMEL CANYON

5a. Biological Characteristics

Biogenic Components

No known hard bottom habitat occurs in this area and no structure-forming invertebrates have been observed or collected as bycatch from this area, however there has been little to no survey effort in this area.

Groundfish Components

The soft sediment slope habitat in this area provides suitable habitat for the subset of managed groundfish species that are associated with soft bottom habitat. The NWFSC occurrence models predict that Area 7 contains high probability habitat for sablefish and longspine thornyhead (Table 5). High probability habitat for abundant focal species (sablefish and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

The proposed Area 7 alters the southeast boundary of the EFH Monterey Canyon Area of Interest to exclude 14.27 sq st miles of slope habitat located between the north end of Point Lobos SMCA and a

proposed addition west of Sobranes Point (Appendix A, Area 7). Area 7 contains slope 1 and 2 habitat ranging in depth from 459 m to 1175 m.

5e. Socioeconomic Characteristics

This area was historically trawled prior to the EFH designation in 2006. It provides an area close to Monterey port (approximately 12 miles) that allows fishermen to set their trawl net at the north end of the area and tow south along the 500 m (273 fathom) contour line. This is the start of a long, deep water tow that follows the 500-600 meter contour line down along the eastern boundary of Point Sur Deep and Big Sur Coast/Port San Luis EFH Conservation Area. Target species in Area 7 are slope rockfish species. The addition of the species landed in this area help provide a diverse portfolio of species that will be more economically viable for the trawl fishermen.

AREA 8 – EXPAND THE POINT SUR DEEP CONSERVATION AREA NORTH TO INCLUDE AN AREA WEST OF SOBRANES POINT

5a. Biological Characteristics

Biogenic Components

No known hard bottom habitat occurs in this area. Only one structure-forming invertebrate - a soft-bottom associated pennatulid - has been observed or collected as bycatch from this area by the 2003 West Coast Groundfish Bottom Trawl survey, however there has been very little survey effort in this area (Appendix A, Area 8).

Table 21: Area 8: Observed Pennatulids (DSCRPT database).

W of Sobranes Point	Common Name	Group	Count
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	1

The southwest portion of this area is also included into SESA 11, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

Groundfish Components

The soft sediment slope habitat in this area provides suitable habitat for the subset of managed groundfish species that are associated with deeper soft bottom slope habitat. The NWFSC occurrence models predict that Area8 contains high probability habitat for sablefish and longspine thornyhead (Table 5). High

probability habitat for abundant focal species (sablefish and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

The proposed area is 37.56 sq st miles and shares boundaries on three sides with an existing EFH boundary: the EFH Monterey Bay/Canyon Conservation Area to the north; the 700 fathom trawl footprint to the west; and the Point Sur Deep and Big Sur Coast/Port San Luis EFH Conservation Area to the south (Appendix A, Area 8). Area 8 includes soft slope habitat ranging in depth from 929 m to 1602 m.

5e. Socioeconomic Data

Conservation stakeholders requested that we add Area 8 to EFH conservation areas as it is not currently trawled by fishermen because it is too deep. The boundary adjustment will extend Point Sur Deep Conservation Area Northeast and will not infringe on any fishing activities.

Fishermen will set their trawl net at the north end of the area west of Carmel and tow south along the 500 m (273 fathom) contour line. Area 8 is seaward of a long trawl path that will follow the 500-600 m contour line down along the eastern boundary of Point Sur Deep and Big Sur Coast/Port San Luis EFH Conservation Area, and as such does not impact trawling activities.

AREA 9 – RE-OPEN AN AREA EAST OF THE POINT SUR DEEP CONSERVATION AREA

5a. Biological Characteristics

Biogenic Components

West Coast Groundfish Bottom Trawl Surveys in or around this area have collected 10 soft-bottom associated pennatulid, including individuals from the Families Virgulariidae, Umbellulidae, and Anthoptilidae. The DSCRTP database contains 1 record of a gorgonian collected from this area.

Table 22: Area 9: Observed Corals, Sponges & Pennatulids (DSCRPT database).

E of Sur Ridge	Common Name	Group	Count
<i>Anthoptilum grandiflorum</i>	Sea Pen	Octocorals	4
<i>Gorgonacea</i>	Soft coral	Soft coral	1

<i>Pennatulacea</i>	Sea Pen	Octocorals	2
<i>Stylatula sp.</i>	Sea Pen	Octocorals	2
<i>Umbellula sp.</i>	Sea Pen	Octocorals	1
<i>Virgulariidae</i>	Sea Pen	Octocorals	1
Grand Total			11

Groundfish Components

The soft sediment slope habitat in this area provides suitable habitat for the subset of managed groundfish species that are associated with deeper soft bottom slope habitat. The NWFSC occurrence models predict that Area 9 contains high probability habitat for sablefish and longspine thornyhead (Table 5). High probability habitat for abundant focal species (sablefish and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

The proposed area alters the eastern boundary of Point Sur Deep and Big Sur Coast/Port San Luis EFH Conservation Area to exclude 42.12 sq st miles of slope habitat located to the east of Sur Ridge (Appendix A, Area 9). Area 9 contains soft slope habitat ranging in depth from 924 m to 1233 m. No known hard bottom habitat occurs in this area.

5e. Socioeconomic Characteristics

This proposed area moves the eastern boundary of Point Sur Deep and Big Sur Coast/Port San Luis EFH Conservation Area EFH even further east. Fishermen historically deployed their net in the north and ran a long tow that will follow the 600 m contour line down along the Sur Ridge geologic feature, as well as seaward of the feature. Moving the EFH boundary east will provide space to follow the contour line in one sweeping trawl path from west of Carmel Canyon, down along east of Sur Ridge and south into the Sur Canyon complex.

Target species in Area 9 are primarily flat fish species. The addition of the species landed in this area help provide a diverse portfolio of species that will be economically more viable for the trawl fishermen.

*AREA 10 – EXPAND THE BIG SUR COAST/PORT SAN LUIS CONSERVATION AREA BY
ADDING A SMALL AREA SOUTH OF SURVEYORS KNOLL*

5a. Biological Characteristics

Biogenic Components

According to the Distribution of Coral and Sponge Standardized Survey Catch (After) this area has a medium to low level of bycatch when the data area considered on a local scale of the MBNMS (based on NMFS's GIS layer of the Distribution of Corals and Sponges off the U.S. West Coast from Standardized Survey Catch (2006-10) from Task 1).

Table 23: Area 10: Observed Pennatulids (DSCRPT database).

Triangle S of Surveyors Knoll	Common Name	Group	Count
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	1

Groundfish Components

The NWFSC occurrence models predict that Area 10 contains high probability habitat for sablefish and longspine thornyhead (Table 5). High probability habitat for abundant focal species (sablefish and

longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

Area 10 is 14.34 sq st miles and shares boundaries on two sides with the Big Sur Coast/Port San Luis EFH Conservation Area. It also connects to Area 9 on the northeast tip and Area 11 on the southwest tip (Appendix A, Area 10). Area 10 includes hard slope habitat ranging in depth from 1027 m to 1155 m. 92% soft bottom habitat occurs in this area, and it has a low habitat diversity (index = 1.33). The southwest area of Area 8 overlaps with the Sur Ridge SESA 11.

5e. Socioeconomic Characteristics

The area as designed should not impact trawling activities.

AREA 11 –RE-OPEN A NORTHERN SECTION OF BIG SUR COAST/PORT SAN LUIS CONSERVATION AREA NEAR THE SUR CANYON SLOT CANYONS

Photo: Widow rockfish from 2004 Delta Sub survey at Pt Sur

5a. Biological Characteristics

Biogenic Component

West Coast Groundfish Bottom Trawl Surveys between in or around this area have observed 1 sea pen.

Table 24: Area 11: Observed Pennatulids (DSCRPT database).

Sur Canyon Slot Canyons	Common Name	Group	Count
<i>Anthoptilum grandiflorum</i>	Sea Pen	Octocorals	11

Groundfish Component

The soft sediment slope habitat in this area provides suitable habitat for the subset of managed groundfish species that are associated with deeper soft bottom habitat. For example, the NWFSC occurrence models predict that Area 11 contains high probability habitat for 5 species: sablefish, longspine thornyhead, and a small area of high probability habitat in the NE part of Area 11 for greenstriped rockfish, darkblotched rockfish and petrale sole (Table 5). High probability habitat for abundant focal species (sablefish, petrale sole and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 and high quality for less abundant focal species (greenstriped and darkblotched rockfish) was identified as the probability of occurrence ≥ 0.25 (based on cutoffs in EFH Synthesis Report p.42).

5b. Spatial and Geological Characteristics

The proposed area alters the northeast boundary of Big Sur Coast/Port San Luis EFH Conservation Area to exclude 68.59 sq st miles of slope habitat located to the southeast of Point Sur Platform (Appendix A, Area 11). Area 11 contains soft slope habitat ranging in depth from 153 m to 598 m. .02% of known hard bottom habitat occurs in this area.

5e. Socioeconomic Characteristics

This proposed area restores access to a historically trawled area that has been fished over multiple family generations. This area provides two primary fisheries: Deepwater complex and shelf rockfish assemblages. Fishermen historically deployed their net in the north and ran a long tow that follows the 500 m contour line down along the Sur Ridge geologic feature, and south into Area 11. Providing the depth contour to 500 m, will provide the deep water fishery complex which is connected to this long tow south. In addition, there is a shallower tow in the northeast region of Area 11 that supplies a commercially important target species to the trawlers - widow rockfish . This is one of two main fishing grounds in the MBNMS that supply this species.

The addition of the species landed in this area help provide a diverse portfolio of species that will be economically more viable for the trawl fishermen.

AREA 12 – EXPAND THE NORTHERN BOUNDARY OF THE BIG SUR COAST/PORT SAN LUIS CONSERVATION AREA TO INCLUDE A SECTION OF THE POINT SUR PLATFORM (ALSO ADD AS A NEW HAPC AREA OF INTEREST)

	
<p>Sponges at northwest corner of Pt. Sur Area</p>	<p>Pink branching hydrocoral (<i>Stylaster norvigicus</i>)</p>

5a. Biological Characteristics

Biogenic Components

The DSCRTP database contains 19 observations corals and sponges from Area 12. These observations include 6 corals, 9 sponges and 4 sea pens (Table 25). In addition, in Area 12 a total of 10 transects have been surveyed by ROV/camera sled by a collaborative research program between CSUMB and MBNMS (Appendix A, Area 12). These surveys have recorded an additional 92 select observations in both still images and video format. Following is an example of the available videos for this area.

This video shows the geological characteristics of the area:

<http://www.youtube.com/watch?v=isWCEHVPy9k>

This video shows some of the rockfish assemblages:

<http://www.youtube.com/watch?v=-5jYdns0-gs>

Grand Total			239

Prohibiting bottom trawling in this area would protect these biogenic species that are highly vulnerable to, and slow to recover from, impacts from bottom trawling.

Groundfish Components

The rocky outer shelf habitat in Area 12 provides habitat for a diversity of managed groundfish species. Area 12 has been extensively surveyed by ROV and camera sled by a collaborative research program between CSUMB and MBNMS and many types of rockfish have been observed (Table 26 and 27 and Appendix A, Area 12). The NWFSC occurrence models predict that Area 12 contains high probability habitat for 2 species: petrale sole and greenstriped rockfish (Table 5). High probability habitat for abundant focal species (petrale sole) was selected as the probability of occurrence ≥ 0.50 and high quality for less abundant focal species (greenstriped rockfish) was identified as the probability of occurrence ≥ 0.25 (based on cutoffs in EFH Synthesis Report p.42).

Through the CSUMB IfAME partnership, the following video on groundfish is available for this area:

<http://www.youtube.com/watch?v=MwqLZnJEReM>

5b. Spatial and Geological Characteristics

The proposed area covers 16.61 sq st miles on the Sur Platform west of the Point Sur State Marine Conservation Area (Appendix A, Area 12). The proposed area includes hard and soft bottom habitat on the shelf between 51m and 112 m. Based on the NMFS benthic substrate data layer, hard substrate is approximated to cover 74.6% of Area 12 (Table 7). However, benthic habitat surveys completed in the north west portion of Area 12 indicate that hard substrate is under-represented in this data layer. Thus, adding Area 12 to the EFH bottom trawl closed areas would protect more than 12.4 square st miles of hard substrate HAPC. This area is also included into SESA 12, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

5e. Socioeconomic Characteristics

The group spent some extended time on this Area 12 in order to ensure it does not negatively impact the trawl fishery. The proposed area is too rocky to trawl, and therefore does not impact groundfish trawl fisheries. However, the area just outside can be trawled in a southward approach. The trawl fishermen set nets just north on the Sur Platform, so we designed the modification to avoid presenting a “buffer” issue meaning not enough room for the fishermen to set their nets and turn to continue a tow without entering Area 12. It’s important to note for this area that the enforcement related changes (see discussion section) are addressed and incorporated as part of this proposal process. The lack of “buffer” for the fishermen is of concern, especially in light of significant fines levied for crossing an EFH boundary.

The group also designated a small “voluntary management area” that extends the southeast boundary (between Area 12 and the RCA) and was selected to include a small extension of rocky reef based at the head of Pt Sur Canyon. The area is not included in the EFH proposal as an addition, yet based on the rocky reef HAPC, and the number of observation of structure forming inverts in this area, there is agreement by the fishermen to observe this as a no trawl zone.

***AREA 13 – EXPAND THE SOUTHERN BOUNDARY OF THE BIG SUR COAST/PORT
SAN LUIS CONSERVATION AREA TO INCLUDE AN AREA BETWEEN PARTINGTON
POINT AND LOPEZ POINT***

<i>Umbellula magniflora</i>	Sea pen of the Genus <i>Funiculina</i>

5a. Biological Characteristics

Biogenic Component

There are 68 records of structure-forming invertebrates including soft corals (Alcyonacea species) and gorgoneans, (sea pens) from ROV surveys and groundfish trawl surveys. Sampling effort has been limited due to distance from ports.

Table 29: Area 13: Observed Corals, Sponges & Pennatulids (DSCRPT database).

	Common Name	Group	Count
Between Partington Point and Lopez Point			
<i>Anthomastus ritteri</i>	Mushroom soft coral	Soft Coral	7
<i>Anthoptilum grandiflorum</i>	Sea Pen	Octocorals	1
<i>Funiculina sp.</i>	Sea Pen	Octocorals	24
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	33

<i>Umbellula magniflora</i>	Sea Pen	Octocorals	3
Grand Total			68

Groundfish Component

The NWFSC occurrence models predict that Area 13 contains high probability habitat for 2 species: sablefish and longspine thornyhead (Table 5). High probability habitat for abundant focal species (sablefish and longspine thornyhead) was selected as the probability of occurrence ≥ 0.50 (based on cutoffs in EFH Synthesis Report p.42). Observations by MBARI (Table 30) are consistent with NWFSC occurrence models in this area.

Table 30: Area 13: MBARI groundfish observations (VARs data query by Linda Kuhnz 7/18/13).

		Area 13
Scientific Name	Common Name	Between Partington Point and Lopez Point
<i>Anoplopoma fimbria</i>	Sablefish	2
<i>Sebastolobus</i>	Longspine and Shortspine Thornyhead guild	126
Grand Total		128

5b. Spatial and Geological Characteristics

This proposed area adds 113.8 sq st miles to the southern boundary of the Big Sur Coast Port San Conservation Area (Table 1.). It is also contiguous to the Big Creek State Marine Reserve and State Marine Conservation Area. The area includes portions of Partington and Lucia Canyon systems and is 100% soft bottom habitat on the shelf between 473m and 1210 m. Relatively low habitat diversity (index=3.28). This area is also a sub set area of SESA 14, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

5e. Socioeconomic Characteristics

This area has very little past or current trawling activity, and therefore did not infringe or impact any current local fishing activities to our knowledge

Lack of agreement on Areas 14 & 15

The group submitting this proposal did not reach agreement on Areas 14 & 15. As a result, the Sanctuary decided to submit these two areas on behalf of the fishing industry and the Sanctuary. Three of the conservation organizations (Oceana, NRDC and Ocean Conservancy) will be submitting an alternative proposal for the region south of 36 degrees North latitude. This is due to the fact that EFH discussions for the region of the sanctuary south of 36 deg. N took place separately from the larger group of collaborating organizations listed on this proposal.

AREA 14 – ADD A NEW CONSERVATION AREA – “LA CRUZ CANYON” (also add as a New HAPC Area of Interest)

	
Rosy rockfish (<i>Sebastes rosaceus</i>)	Phylum <i>Porifera</i> and Class <i>Crinoidea</i>

5a. Biological Characteristics

Biogenic Components

Groundfish survey trawls in shelf and shelf break habitat have captured corals immediately outside this proposed area. CSUMB surveys to characterize benthic habitats and communities (using camera sled and ROVs) have occurred at multiple locations in shelf and shelf break habitats and have observed 3 sea pen/sea whip and 366 sponges at this site.

Table 31: Area 14: CSUMB Observed Invertebrates (2007-2012).

La Cruz Canyon Area	Common Name	Group	Count
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	3
<i>Porifera</i>	Sponge (>10 cm)	Sponge (>10 cm)	366
Grand Total			369

Groundfish Components

The NWFSC occurrence models predict that Area 14 contains high probability habitat for 4 species: sablefish, petrale sole, darkblotched rockfish and greenstriped rockfish (Table 5). High probability habitat for abundant focal species (sablefish and petrale sole) was selected as the probability of occurrence ≥ 0.50 and high quality for less abundant focal species (darkblotched rockfish and greenstriped rockfish) was identified as the probability of occurrence ≥ 0.25 (based on cutoffs in EFH Synthesis Report p.42).

Table 32: Area 14: CSUMB Groundfish Observations (2007-2012).

		Area 14
Scientific Name	Common Name	La Cruz Canyon Area

<i>Ophiodon elongatus</i>	Lingcod	23
<i>Sebastes paucispinis</i>	Boccacio	3

<i>Young of Year (YOY)</i>	Rockfish <5cm (scholO	488
Grand Total		588

5b. Spatial and Geological Characteristics

This area is proposed as a new HAPC area of interest as well as a new EFH Conservation Area, and is located just north of Piedras Blancas SMCA and SMR. It overlaps the RCA and is located at the head of La Cruz Canyon. The area would add 13.4 sq st miles to EFH and is located on the shelf in a relatively shallow depth range (95-354 m). The area contains a geologic feature of mainly hard substrate (83.2%); 11.16 sq st miles represent a rocky reef HAPC that sits on the outer shelf and shelf break. This area has the second highest habitat richness (10 habitats) and habitat diversity (index = 4.40). This area is also included into SESA #15, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

5e. Socioeconomic Data

Fishermen associated with the California Risk Pool prepare and adopt their own “Fishing Plans” and enforced related fishing rules that were intended to reduce the risk of an unintentional harvest of OFS. The goals of each Fishing Plan are to promote the long-term success of the fishery and its supporting port communities, by:

- maximizing the harvest of target species from the fishery;
- minimizing the take of OFS from the fishery,
- safeguarding sensitive fish habitat off the Pacific Coast; and
- contributing to the rebuilding of OFS stocks.

The Industry in the Morro Bay area have provided input that Area 14 has a high likelihood of catching an unacceptable amount of overfished rockfish species, it consists of sensitive habitat that is worthy of being protected, and with this design there will still be fishing opportunity shoreward and seaward of the hard bottom.

The Sanctuary and fishing industry also designated a larger, “voluntary management area” that was selected based on the observations sea pens, sea whips and sponges in this area (CSUMB data).

AREA 15 – ADD A NEW CONSERVATION AREA – “EXTENSION OF PIEDRAS BLANCAS STATE MARINE CONSERVATION AREA”

	
Large sponge (Phylum <i>Porifera</i>)	Class <i>Crinoidea</i>

5a. Biological Characteristics

Biogenic Components

The West Coast Groundfish Bottom Trawl Survey has identified one sea whip from a 2007 survey.

Table 33: Area 9: Observed Pennatulids (DSCRPT database).

West of Piedras Blancas SMCA	Common Name	Group	Count
<i>Pennatulacea</i>	Sea Pen or Whip	Octocorals	1

Groundfish Components

The NWFSC occurrence models predict that Area 15 contains high probability habitat for 4 species: sablefish, petrale sole, darkblotched rockfish and greenstriped rockfish (Table 5). In addition, 61 observations of groundfish were documented in this area. CSUMB has spent a fair amount of effort in this area (Appendix A, Area 15) and observed a many rockfish (Table 34) although there is no known hard bottom mapped in this area.

Table 34: Area 15: CSUMB Groundfish Observations (2007-2012).

		Area 15
Scientific Name	Common Name	<i>West of Piedras Blancas SMCA</i>
Canary/Vermilion/Yelloweye complex	Canary/Vermilion/Yelloweye complex	61
<i>Ophiodon elongatus</i>	Lingcod	1
<i>Sebastes paucispinis</i>	Boccacio	1
<i>Young of Year (YOY)</i>	Rockfish <5cm (usually in a school)	67
Grand Total		130

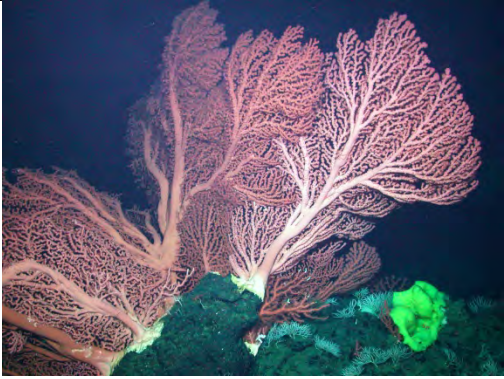

5b. Spatial and Geological Characteristics

This area is proposed as a new EFH Conservation Area and is located contiguously to the Piedras Blancas SMCA, in fact it was designed as an extension to the SMCA. This area has not been officially surveyed for substrate and yet is identified as “rocky” on the NOAA chart. Numerous fishermen have noted this is a rocky area to be avoided. The area would add 4.48 sq st miles to EFH Conservation Areas and is located on the shelf in a relatively shallow depth range (72-119 m). This area has low habitat richness (2 habitats) and habitat diversity (index = 1.49). The northern end of this area is included in SESA 14, which was identified by the Sanctuary as a location of unique, rare, or important habitat.

5e. Socioeconomic Characteristics

Please see Area 14 discussion as it applies to this area as well. We also discussed that placing a federally protected area next to a state area will promote cross agency collaboration on studies.

DAVIDSON SEAMOUNT CONSERVATION AREA – No CHANGES

	
<p>Bubblegum coral (<i>Paragorgia arborea</i>) Photo: MBARI/NOAA</p>	<p>Basket star atop the sponge from the Genus <i>Staurocalyptus</i>. Photo: MBARI/NOAA</p>

The proposal requests no changes to the boundaries of the Davidson Seamount Conservation Area, which prohibits all bottom contact gear, or any other gear that is deployed deeper than 500 fathoms in the Davidson Seamount Management Zone of the MBNMS. There are a total of 20,541 invertebrate observations from the DSCRTP database within the Davidson Seamount Management Zone: 104 pennatulids and 20,437 corals.

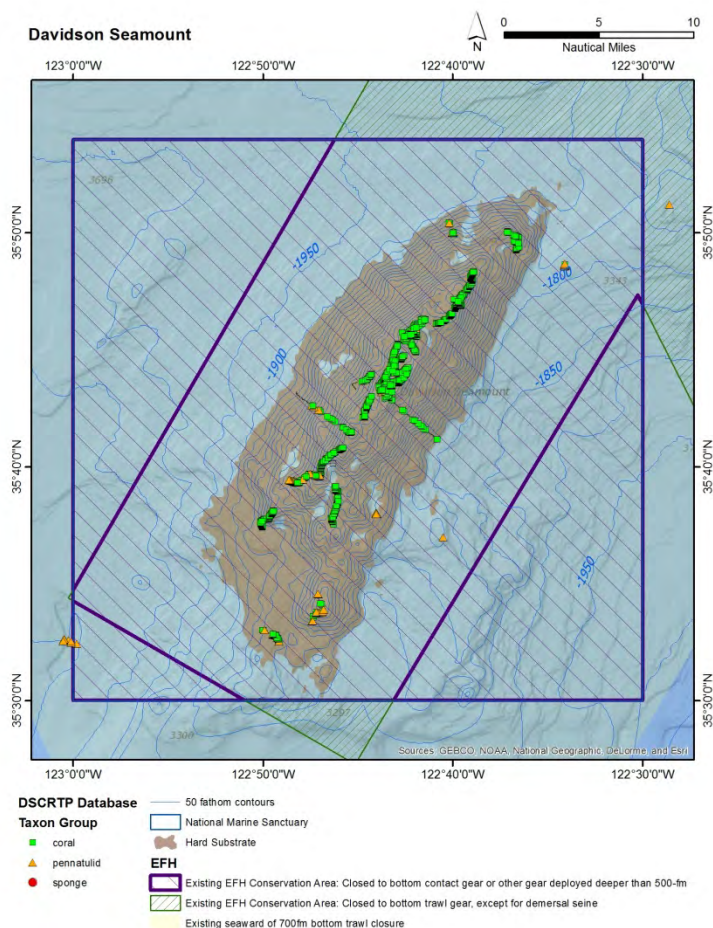

Figure 6: Davidson Seamount Management Zone Biogenic Data.

6. DISCUSSION

In 2006, EFH and the related regulations went into effect, resulting in 4,103 square statute miles of MBNMS being closed to trawl gear, through a combination of EFH Bottom Trawl Conservation Areas and the 700 Fathom Trawl Footprint Closure. In 2009, EFH was amended for Davidson Seamount Management Zone to include restrictions for bottom contact gear. For the trawl fleet, the 2006 EFH regulations closed approximately 68% of the area within the Sanctuary to bottom trawling. MBNMS staff, while mostly satisfied with the 2006 EFH footprint in the sanctuary felt that the groundfish EFH 5-yr review was an opportunity for refining boundaries based on: 1) increased protection for sensitive benthic habitats not included within current EFH Bottom Trawl Conservation Areas; 2) new information on the presence and location of biogenic habitat and groundfish that had not been available during the 2006 EFH process; 3) maintaining a sustainable local groundfish fishery; and 4) community need for a broadly collaborative process in this region. Through careful analysis of data and other information, MBNMS facilitated an agreement that resulted in an additional proposed 259.6 sq st miles of added EFH Conservation Areas and a proposed 153.3 sq st miles of re-opened trawl grounds in currently closed areas to improve trawl fishing opportunities.

In developing this proposal, one of the main objectives was to determine if there are areas in the sanctuary that contain habitats important to groundfish FMP stocks that are vulnerable to bottom trawling. We analyzed available data on rocky habitat, soft bottom (e.g., unconsolidated sediments), and biogenic habitat in the sanctuary, but focused most of our attention on determining the location and presence of hard bottom, corals, and sponges because these habitats are important to groundfish, very sensitive to impacts from bottom trawling, and are slow to recover from impacts. Soft-bottom habitats are also important to groundfish FMP species and our proposal seeks to increase the overall area of this habitat type in EFH Bottom Trawl Conservation Areas. However, given the high abundance of this habitat and its lower sensitivity, combined with the relatively high value of some currently closed soft bottom areas to the trawl industry, this habitat was the focus of strategic trade-offs between proposed new additions and re-openings.

HABITATS

The following sections briefly discuss the data and information provided in the EFH Phase 1 Report, the EFH Synthesis Report, as well as the EFH-FEIS and Amendment 19, and how that information was used to devise the proposed modifications to EFH in MBNMS. In addition, it summarizes site specific data (when available) to further understand the presence and location of habitats important to groundfish FMP stocks, the relative vulnerability of habitats to impacts from bottom trawling, and socioeconomic information on the location of high value areas to re-open for the local trawl fishery.

Rocky Habitat

As defined in the Groundfish FMP, rocky habitat may be composed of bedrock, boulders, or smaller rocks, such as cobble and gravel. Rocky habitats are one of the least abundant benthic habitats, especially in deeper waters. A first approximation of its extent is provided by the substrate data in the groundfish EFH assessment GIS. According to the EFH Synthesis Report, hard and mixed substrates appear to be

relatively rare (7.2% and 3.3%, respectively) when compared coast-wide to soft substrate (89.5%). Based on the substrate data layers in the EFH Phase 1 Report, 6.8% of the seafloor in the MBNMS study region is rocky habitat (Table 7).

It should be noted that the majority of the federal waters within MBNMS study area has not been surveyed for fine-scale substrate information (e.g., by sidescan sonar, multibeam or visual observation) so most habitats are unknown and are therefore shown as soft sediment. However, through direct observation, it has been possible to further distinguish between hard and soft substrate in a few areas in the sanctuary. For example, we have visual data that confirms that hard substrate is under-represented on the Point Sur Platform (Area 12) and there is some information that hard substrate is present in Area 15. We have been working to increase our information on benthic habitat through visual surveys in some of these areas (e.g., 1, 2, 12, 14, 15) and we will continue to do so (hopefully in some of the re-open areas) as funding allows. However, for the purpose of this proposal, we had to use the best available data to identify the location of hard bottom habitat

As noted in the Groundfish EFH-FEIS, hard substrates are one of the least abundant benthic habitats, yet they are among the most important habitats for groundfish. Many managed species are dependent on offshore hard bottom habitat during some portion of their life cycle. Typically, deeper water hard bottom habitats are inhabited by large, mobile, nektonic fishes such as rockfish, sablefish, Pacific hake, spotted ratfish, and spiny dogfish (MMS 2002). Cross and Allen (1993) estimated that about 30% of the fish species and 40% of the families occur over hard substrates. The Groundfish EFH-FEIS notes 56 managed groundfish species that use hard bottom habitats during one or more life stages.

In addition to its importance as groundfish habitat, rocky habitat is thought to be sensitive to, and slow to recover from, impacts from bottom trawling. Impacts of bottom trawling include the possible alteration of physical formations such as boulders and rocky reef formations and the removal of associated biogenic species (e.g., corals, and sponges) that may provide structure for prey species (PFMC 2011a). As noted in the EFH Phase 1 Report, hard gravel/pebble/cobble pavements, ridges, boulder fields, and pinnacles are generally considered to be static habitats that only typically vary as a result of punctuated, high energy events (e.g., geologic activity, tsunamis). Recovery after disturbance may be long-term (years to decades), and in some cases the alteration to the physical structure may be permanent.

Given its relative importance to groundfish, rarity, and sensitivity to impacts, rocky habitat has been designated as a HAPC for Pacific Coast Groundfish. In MBNMS, currently 57.5 sq st miles of rocky reef HAPC is outside of current trawling prohibitions (EFH Bottom Trawl Conservation Areas, EFH 700 fm bottom trawl footprint closure, and Trawl Rockfish Conservation Area) and therefore, vulnerable to impacts from this activity. This proposal will add 42.1 sq st miles of this vulnerable rocky reef HAPC to EFH Bottom Trawl Conservation Areas (Table 2).

Biogenic Habitat

As discussed in the EFH-FEIS, biogenic species, including corals, anemones, sponges, sea pens, and sea whips, grow up from the ocean floor and increase the complexity of the benthic environment, a possibly unique ecological function. There is little data to support conclusions about the role of these organisms on the West Coast; however, studies from other areas of the world demonstrate that corals in particular

support complex ecological communities and increased biodiversity in comparison with areas without corals. The role of corals, sponges, sea pens, and sea whips in the lives of groundfish have not been clearly demonstrated. Several groundfish FMP species, including arrowtooth flounder, big skate, California skate, Dover sole, lingcod, longspine and shortspine thornyhead, sablefish, spotted ratfish, and a variety of rockfish, have been observed in association with these benthic organisms. A recent study off the eastern coast of Canada observed rockfish larvae (*Sebastes* spp.) in close association with five species of sea pen, which may act as nursery habitat providing shelter to larval fish (Baillon et al. 2012). However, additional study is required to draw definitive conclusions.

As discussed in the EHF Phase 1 report, empirical research indicates that biogenic habitat is the habitat type most adversely impacted by fishing gear. Impacts of bottom trawling to physical and biogenic habitats include removal of corals and sponges that may provide structure for prey species and possible alteration of physical formations, such as boulders and rocky reef, on which these species attach (PFMC 2011a). Corals, anemones, sponges, sea pens, and sea whips are a highly sensitive habitat that may be substantially modified with relatively little fishing effort (NRC 2002). Hyland et al. (2005) observed a site in the OCNMS containing patches of stony coral with large proportions consisting of dead and broken skeletal remains and broken gorgonian coral. There was also evidence of bottom trawling and derelict fishing gear within the same study site. It may be that initial contact (i.e., the first time gear is deployed) is the most important due to the high sensitivity of the habitat to impact. Highly sensitive habitat may be most impacted by initial contact with fishing gear.

As discussed in the groundfish EFH-FEIS, there have not been many studies of how these organisms recover from initial impact. However, growth rates of corals in particular suggest that recovery is in excess of seven years and likely to be much longer (Roberts and Hirshfield 2004). Kaiser et al. (2006) found that slow-growing large-biomass biota such as sponges and soft corals took much longer to recover (up to 8 years) than biota with shorter-life spans such as polychaetes (< 1 yr). Fujioka (2006) recommended using longer estimates of recovery time for hard corals, on the order of 100 years, and developed a Long-term Effect Index (LEI), which calculated an estimate of the proportion of each habitat type in each cell impacted over the long-term under current levels of effort. The LEI results for hard corals were typically greater than 50 percent even under low levels of trawl effort. Also noteworthy is that in 2010, NOAA released a Strategic Plan for Deep-Sea Coral and Sponge Ecosystems that noted habitats where deep-sea corals or sponges occur have been identified as EFH for a number of fisheries. Additionally, the Plan states that NOAA takes a precautionary approach to manage bottom-tending gear, especially mobile bottom-tending gear, and other adverse impacts of fishing on deep-sea coral and sponge ecosystems. One of the tools identified is the use of EFH management measures.

Information on the presence and location of coral and sponge on the west coast has been greatly improved since the earlier EFH 2005 process, through the DSCRTP database and associated maps and tables, provided in the EFH Phase 1 and Synthesis Reports. One of the conclusions in the NMFS Synthesis Report is that current EFH Conservation Areas protect some deep-sea coral, sponge, and pennatulid habitat, but a substantial amount of this habitat remains outside EHF Conservation Areas. Out of the over 4,100 grid cells with coral/sponge presence, 71% remain outside EFH conservation areas, and 16.7% of

those occur in the central sub-region. For grid cells with pennatulid presence, 73% are outside EFH conservation areas, and 35.7% of those occur in the central sub-region.

The synthesis report also noted that there are numerous sites outside EFH conservations areas where corals and sponges have been observed in higher relative numbers, include portions of Monterey Bay and near the shoreward boundary of the Big Sur Coast/Port San Luis area. Mapping of coral, sponge, and pennatulid observations from the DSCRTP database in the MBNMS study area confirmed that 39% of the observations - 1,753 corals, 122 sponges, and 21,557 pennatulids, were outside current EFH CA boundaries [Table 3]. The report also noted that large areas have not been surveyed so we supplemented the biogenic data provided using direct observations from camera sled and ROV surveys in MBNMS when available. In doing so, we identified many additional observations of corals and sponges outside EFH Conservations Areas (see CSUMB coral and sponge data displayed in Figure 3).

The proposed actions would result in increased protection of highly sensitive biogenic habitat that is vulnerable to bottom trawling. Based on the observations in the DSCRTP data, the proposed additions the EFH Bottom Trawl Conservation Areas would include 397 coral, 50 sponge, and 382 pennatulid observations (Table 2). Data from additional visual surveys by CSUMB in Areas 2, 12, and 14 indicates that the addition of these areas to groundfish EFH Bottom Trawl Conservation Areas would protect an additional 636 sponge and 160 pennatulid observations from potential impacts from bottom trawling. (Table 4)

The Magnuson-Stevens Fishery Conservation and Management Act (MSA) allows NOAA to manage fishing-related threats to deep-sea corals and sponges in federal waters through fishery management plans developed in conjunction with the Regional Fishery Management Councils. The MSA was amended in 2007, requiring NOAA to establish the Deep Sea Coral Research and Technology Program and providing new discretionary authority to protect deep-sea coral and sponge areas from damage caused by fishing gear. Given the potential importance of this habitat based on studies from other areas and the high sensitivity of this habitat to impacts from bottom trawling, a precautionary approach to minimize vulnerability of deep sea coral and sponge to bottom trawling is supported by this proposal.

Soft-bottom Habitat

As defined in the Groundfish FMP, offshore, unconsolidated bottom habitats are composed of small particles (i.e., gravel, sand, mud, silt, and various mixtures of these particles) and contain little to no vegetative growth due to the lack of stable surfaces for attachment. Soft bottom habitats are the most abundant benthic habitats, especially in deeper waters. A first approximation of its extent is provided by the substrate data in the groundfish EFH assessment GIS. According to the EFH Synthesis Report, soft bottom is relatively abundant (89.5%) coast-wide when compared to rocky and mixed habitat (7.2% and 3.3%, respectively). Based on the substrate data layers in the EFH Phase 1 Report, 93.2% of the seafloor in the MBNMS study region is soft bottom (Figure 4, Table 7).

Fish species commonly occurring over soft bottom benthos include skates and rays, smelts, surfperches, and flatfishes; however, other species may predominate in certain areas (e.g., white croaker, hagfish, and ratfish (MMS 2002)). In the Southern California Bight, about 40% of the fish species and 50% of the families occur in soft-bottom areas of the open coast (Cross and Allen 1993). A large number of managed

groundfish species utilize offshore unconsolidated bottom habitat during at least part of their life cycle including arrowtooth flounder, big skate, butter sole, California skate, curlfin sole, Dover sole, English sole, flathead sole, leopard shark, lingcod, longnose skate, longspine and shortspine thornyhead, Pacific cod, Pacific rattail (grenadier), Pacific sanddab, petrale sole, rex sole, rock sole, sablefish, sand sole, soupfin shark, spiny dogfish, spotted ratfish, starry flounder, and 28 species of rockfish.

As discussed in the EHF Phase 1 report, empirical research indicates that soft bottom habitat is the habitat type least adversely impacted by bottom trawling, as compared to biogenic habitat and rocky habitat. Some recent studies, including those performed on the U.S. West Coast, found impacts of trawling on soft sediment habitats to include:

- Alteration of the physical structure of the seafloor, such as decreases in the amount of biogenic mounds, depressions, and flocculent material and/or increases in the amount of trawl tracks and exposed sediment (Engel and Kvitek 1998, de Marignac et al. 2008, Lindholm et al. 2012);
- Lower densities of demersal fish and epibenthic macro-invertebrate communities (Engel and Kvitek 1998, Hixon and Tissot 2007; de Marignac et al. 2008; Hannah et al. 2010);
- Enhanced abundance of smaller-bodied fauna, opportunistic species, and certain prey important in the diet of some commercially important fishes such as flatfishes (Engel and Kvitek 1998, Kaiser et al. 2006);
- Lindholm et al. (2008) studied patterns in the distribution of the sea whip in an area impacted by mobile fishing gear off the central California coast and found that the marked difference in the occurrence of upright sea whips among video transects may be attributable to water depth and/or impacts from otter trawling.

In a recent study of trawling impacts and recovery of soft bottom habitat at a depth of approximately 170 m off central California (Morro Bay area), Lindholm and colleagues (2012) found little to no detectable impact of trawling on the physical topography and biological community, except for persistent scour marks from trawling gear. In addition, the invertebrate assemblage in the study area was found to be highly variable in both space and time, suggesting that aspects of this habitat can be dynamic, making it difficult to understand and predict the impacts of trawling on the benthic community. Several of these publications on the impacts of bottom trawling on soft bottom habitat have noted that little has been written about recovery of seafloor habitat from the effects of fishing and that there is a lack of long-term studies, control sites, or research areas, which hinder the ability to fully evaluate impacts.

Given the importance of soft bottom habitat to many groundfish FMP species and the occurrence of biogenic species – sea pens and sea whips - that can be negatively impacted by trawling, this proposal aims to increase the total amount soft bottom habitats in MBNMS that is protected from bottom trawling by identifying 217.5 sq st miles for inclusion in EFH Bottom Trawl Conservation Areas. In addition, based on the apparent lower sensitivity of this habitat to significant long-term negative impacts from bottom trawling and the importance of soft-bottom habitat to the economic viability of the local groundfish trawl fishery, this proposal also identifies 152.7 sq st miles to re-open to groundfish bottom

trawl fishery. The net outcome of the proposal is a net increase in the amount of soft bottom habitat in EFH Bottom Trawl Conservation Areas of 64.8 sq st miles (Table 2).

Submarine Canyon

As discussed in Amendment 19 to the groundfish FMP (pg 69), canyons are complex habitats that may provide a variety of ecological functions. Shelf-edge canyons have enhanced biomass due to onshore transport and high concentrations of zooplankton, a principal food source of juvenile and adult rockfish (Brodeur 2001). Canyons may have hard and soft substrate and are high relief areas that can provide refuge for fish, and localized populations of groundfish may take advantage of the protection afforded by canyons and the structure-forming invertebrate megafauna that grow there (Monterey Bay National Marine Sanctuary 2005). A canyon in the North Pacific was observed to have dense aggregations of rockfish associated with sea whips (*Halipteris willemoesi*), while damaged sea whip “forests” had far fewer rockfish (Brodeur 2001). During surveys in the headward part of Soquel Canyon, Yoklavich and colleagues (2000) observed a high abundance of adult rockfishes in association with rock habitats along the sides of Soquel Canyon, suggesting that this canyon may serve as a natural harvest refuge for economically valuable rockfishes.

This proposal aims to increase the amount of canyon habitats in MBNMS that is protected from bottom trawling. We have identified 69.2 sq st miles for inclusion in EFH Conservation Areas, 20% of which is hard bottom canyon habitat (Table 35). We have identified 37.9 sq st miles of canyon habitat to re-open for the groundfish bottom trawl fishery, comprised almost entirely of soft bottom canyon habitat (0.4 sq st miles of hard bottom canyon habitat). The net outcome of the proposal is a net increase in the amount of canyon habitat in EFH Bottom Trawl Conservation Areas of 31.3 sq st miles (Table 35).

Table 35: EFH Proposed Boundary Modifications: Summary Statistics.

		Area (sq st mi)		Habitat Percentage		Area (sq st mi) by Canyon/Non-canyon	
EFH Modification	Area (sq st mi)	hard bottom	soft bottom	hard bottom	soft bottom	Canyon	Non-canyon
add to EFH	259.6	42.1	217.5	16.2%	83.8%	69.2	190.4
reopen EFH	153.3	0.6	152.7	0.4%	99.6%	37.9	115.4
Net add to EFH	106.3	41.5	64.8	39.1%	60.9%	31.3	75.0

Juvenile Habitat

As discussed in the synthesis report, quantity or quality of juvenile habitat can play a critical role in the population dynamics of many groundfish FMP species. However, there is a general lack of habitat

information for most juvenile groundfishes. In a recent study in MBNMS to estimate the relative abundance of habitats on the shelf (65-110 m) and to examine demersal fish species composition, diversity, density, and sizes relative to these habitats, Laidig and colleagues (2009) noted that the abundance of immature fishes in the study area may indicate that this area of the shelf is a nursery for younger fishes. This area on the continental shelf at intermediate depth may be an ontogenetic transition zone for immature fishes - a staging area between the shallow, nearshore young-of-the-year habitats and deeper, adult habitats.

Three of the areas proposed for addition to EFH Bottom Trawl Conservation Areas - Areas 2, 12, and 15 - overlap substantially with this intermediate depth zone (30-100 m) that may serve as juvenile habitat for some groundfish FMP species. Area 2 overlaps substantially with the area studied by Laidig and colleagues in 2009. Though Areas 12 and 15 have not received the same level of sampling effort or data analysis as Area 2, there are observations of juvenile groundfish in both areas (see Groundfish Components summaries for each area in Section 5a). In particular, visual surveys in Area 12 by CSUMB between 2007-2012 have recorded 3,047 observations of young-of-the-year (YOY) rockfishes (<5 cm, usually in schools).

As noted in the 2009 study, a generalized understanding of the importance of this intermediate depth zone is hampered by the relatively few habitat surveys focused on the intermediate depths (30–100 m) of the continental shelf off the west coast of the United States. In addition, Laidig et al. (2009) note that historical fishing pressure in the study area may have contributed to the lack of large, mature fishes. Inclusion of Areas 2, 12, and 15 to EFH Bottom Trawl Conservation Areas, would lend protection to this potentially important juvenile habitat and would allow for research on the potential nursery role of these areas to occur without the confounding effects of trawling impacts.

ADDITIONAL MANAGEMENT OPTIONS

Voluntary Management Areas

During the stakeholder meetings, the full group identified two areas that had concerns from conservation representatives as areas that have observed biogenic habitat, and could be adversely affected by trawling. The fishermen agreed that if the coordinates could be provided, they would as a precautionary approach voluntarily avoid these areas for a specified time period (exact time TBD). In addition, the Sanctuary and fishing industry stakeholders identified an additional Voluntary Management Area in the vicinity of Area 14 and 15. The group will develop a process that includes further investigation of the areas, evaluation of the effectiveness of this experimental, pilot concept, how to set agreed upon time limits for continued close or reopen scenarios, and a timeline for this process development. Putting the areas into “voluntary management” status now, will alleviate the fishermen’s concern about adding small areas that may put them in a challenging position if closed through regulation, and will provide a test of this new, experimental concept for habitat protection. Following is a brief description of each area:

- **South of Area 2 by Davenport:** South of Area 2 is a small “voluntary management area” that was selected based on a small outcropping of rocky reef and hundreds of observations of

pennatulids in this area from MBARI ROV dating back to 1993. This area is not officially included in the proposal, yet based on the density of pennatulids on a rocky reef, there is agreement by the fishermen to observe this as a no trawl zone.

- **South of Area 12 close to the Pt Sur Platform:** Connected to and south of the Pt Sur Platform area the group agreed upon a small “voluntary management area” that extends the southeast boundary (between the Area 12 and RCA) and was selected to include a small extension of rocky reef based at the head of Pt Sur Canyon. This rocky reef HAPC had a number of observations of structure forming inverts in this area, and so there is agreement by the fishermen to observe this as a no trawl zone.
- **Around Area 14 at La Cruz Canyon (not proposed through consensus):** Lastly, the fishermen and Sanctuary designated a larger, “voluntary management area” that was selected based on the observations of sea pens, sea whips and sponges in this area (CSUMB 2007-2012 data). This area is not included in this EFH proposal as an addition, yet based on the numbers of biogenic inverts on the rocky reef, there is agreement by the fishermen to observe this as a no trawl zone.

Changes to Enforcement of Spatial Areas

Key sensitive Essential Fish Habitat types for groundfish are in many cases located in close proximity to high value areas to the groundfish fishery. Therefore, efforts to “minimize to the extent practicable adverse effects to EFH by fishing” are largely dependent on the ability to develop highly tailored and enforceable spatial boundaries for open and closed areas to bottom trawling at a high/fine level of spatial resolution. The current enforcement of spatial bottom trawl closures (RCAs, EFH, etc) uses Vessel Monitoring Systems with a ping rate of approximately one hour. At this ping rate with a trawl speed of 2 to 3 knots, effective VMS enforcement will require the size of the trawl closure to approach 3-4 miles in diameter. While VMS as currently configured with the one hour ping rate is appropriate for large-scale closures where there is less concern about fishing near the boundaries, it is insufficient for enforcement of fine-scale closures and boundaries.

The problems include an inability to know the precise trawl path and difficulty discerning whether fishing is actively taking place. The relevant consideration for EFH enforcement is whether the trawl net is in contact with the seafloor. As a result, bottom trawl fishermen have uncertainty about whether they may be committing a violation when they are fishing in close proximity to closed areas, if they drift into a closed area while retrieving their net, or if they drift into a closed area as a result of hanging their gear on a snag or loss of engine power. Conversely, enforcement officials have uncertainty about where exactly fishermen are fishing, whether they are intentionally fishing inside closed areas, and when active fishing is taking place. The practical effect of implementing small closures is that it is difficult to design small scale closures that allow fishing in proximity to sensitive EFH areas. As a result, closed area boundaries around habitat features must be much larger than the boundaries of the feature itself to ensure protection, at the potential expense of closing valuable fishing grounds where impacts would be minimal.

Proposed solution: We propose that as part of the revised EFH regulations, a new enforcement regime is implemented to include:

- Changing the VMS ping rates from 1 hour to 15 minute intervals to more precisely indicate the location of the vessel track while fishing is occur
- Requiring the use of hydraulic sensors to determine precisely when trawl nets are retrieved and deployed.
- Requiring depth sensors to record the active fishing depth of the trawl net in relation to the seafloor.
- Requiring the recording and reporting of these sensory data by means of an electronic log book.

These changes will allow fishermen to fish in close proximity to the boundaries of closed areas without fear of being accused of fishing in a restricted area and enforcement will have confidence that fishermen are in compliance, hence removing all ambiguity. In other words, there will be no need for “buffers” around habitat features to ensure their protection and lines can be drawn tightly to encompass actual trawl tow track lines to ensure precautionary habitat protection.

The electronic logbook (E log) may be the most important and appropriate tool, potentially avoiding the need to increase VMS ping rates, though these tools may also be used in concert. As envisioned, development of a west coast E log would follow the same strategy as the development of the west coast electronic fish ticket (E ticket). The E log would emulate the numerous state (paper based) log books through a series of drop down fields. Data collection would be done through sensors and vessel operator inputs. Sensors on the hydraulics and net drum(s) would lay down a lat/long and time/date stamp recording on a laptop located in the wheel house. Depth sensors would record the “fishing” depth of the net in relation to the sea floor. The vessel operator would input species tow data on a per tow basis. The data package could be uploaded through the vessel VMS system for real time reporting, or alternatively could be sent as an email attachment once in range of a cell tower while the vessel is returning to port or within 24 hours of off load (same reporting requirement at E Tickets).

Once the data has been received, state, PSMFC, and Federal fishery managers and scientist would use the data consistent with current practices, but in a much more timely fashion and with much more confidence in the data itself.

In summary, these measures will allow more targeted and refined management of EFH, better achieving the dual objectives of minimizing adverse impacts to habitat while maintaining vibrant fisheries. These measures will provide greater security to fishermen and confidence in their compliance. These changes are consistent and enabled by the current move towards Electronic Monitoring of west coast fisheries, including catch shares. Therefore, the additional costs of implementation in the context of spatial management should be lower.

Future Benthic Research and Monitoring Plan

The group recommends the National Marine Sanctuary Program develop and fund a monitoring plan for the MBNMS HAPC/EFH Conservation Area to ensure that site objectives are met over the long-term. We also discussed the possibility of working together on a future opportunity to obtain a collaborative

fisheries grant. Some ideas for research foci include looking at changes over time in areas to be reopened to bottom trawling with the purpose of detecting and monitoring the extent of impacts once trawling resumes.

In addition, MBNMS is formulating a research and monitoring plan to collect visual data in many of the proposed areas. Some of research and monitoring will occur as an extension of on-going studies. For example, the collaborative research partnership between MBNMS and CSUMB IfAME lab just completed ROV benthic surveys in portions of Areas 1, 2 and 12. MBARI has expressed interest in doing ROV surveys to help collect data in SESAs. MBNMS and the collaborating conservation organizations on this proposal are interested seeking funding for studies to monitor changes over time in areas reopened to bottom trawling with the purpose of detecting and monitoring the extent of impacts when trawling resumes.

APPENDIX B: FIGURES OF SPECIES HABITAT MODELS FOR 6 GROUND FISH SPECIES & NEW DATA

Both NWFSC and NCCOS modeled the occurrence and abundance of six groundfish that were chosen to represent a rough proxy for the diversity of species among assemblages of West Coast groundfish and are presented with the MBNMS proposed EFH boundary modifications. The models were based on NMFS bottom trawl surveys and the NWFSC models included some in-situ observations from NMFS. The fish species habitat model maps include both observations and effort for in-situ observations of the groundfish by MBARI and CSUMB to help us compare between the results from the models and in-situ observations within the MBNMS. Appendix C includes occurrence and abundance model maps for six species, Sablefish (ANFI), Longspine Thornyhead (SEAL), Petrale Sole (EOJO), Yelloweye Rockfish (SERU), Greenstriped Rockfish (SEEL), and Darkblotched Rockfish (SECR).

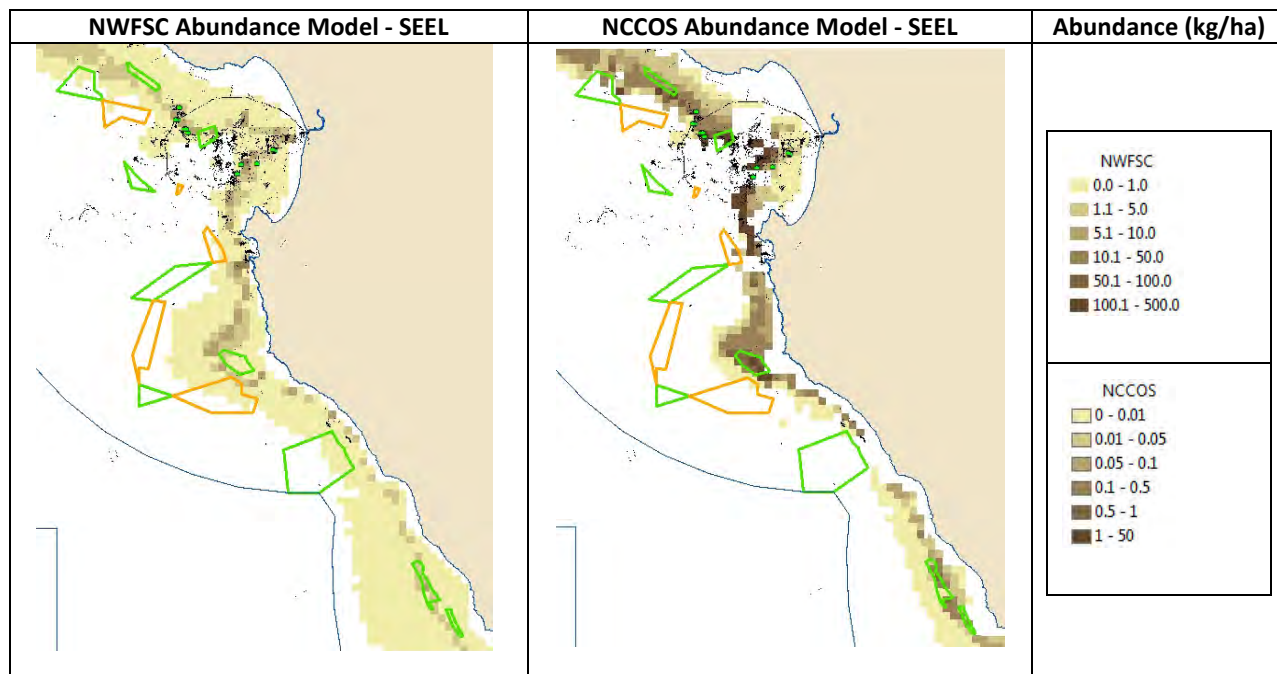

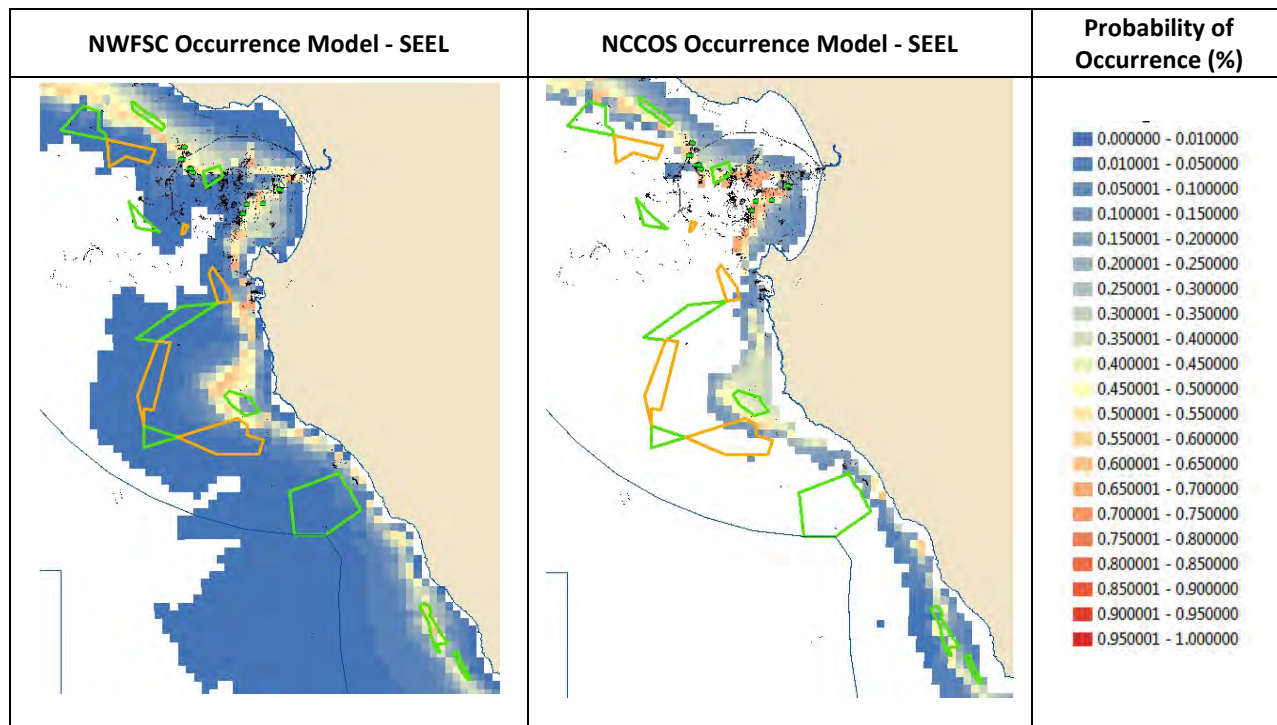

Darkblotched Rockfish (*Sebastes crameri*, SECR)

Darkblotched RF (SECR) prefer soft sediments on a narrow range of slope (~100m to 400m) and are not common south of Pt. Reyes. Darkblotched RF (yellow dots) have been identified by MBARI ROV transects (black) and seem to utilize the medium quality habitat predicted by the NWFSC and NCCOS models, except on smooth ridge where they were seen and the models indicate low probabilities.

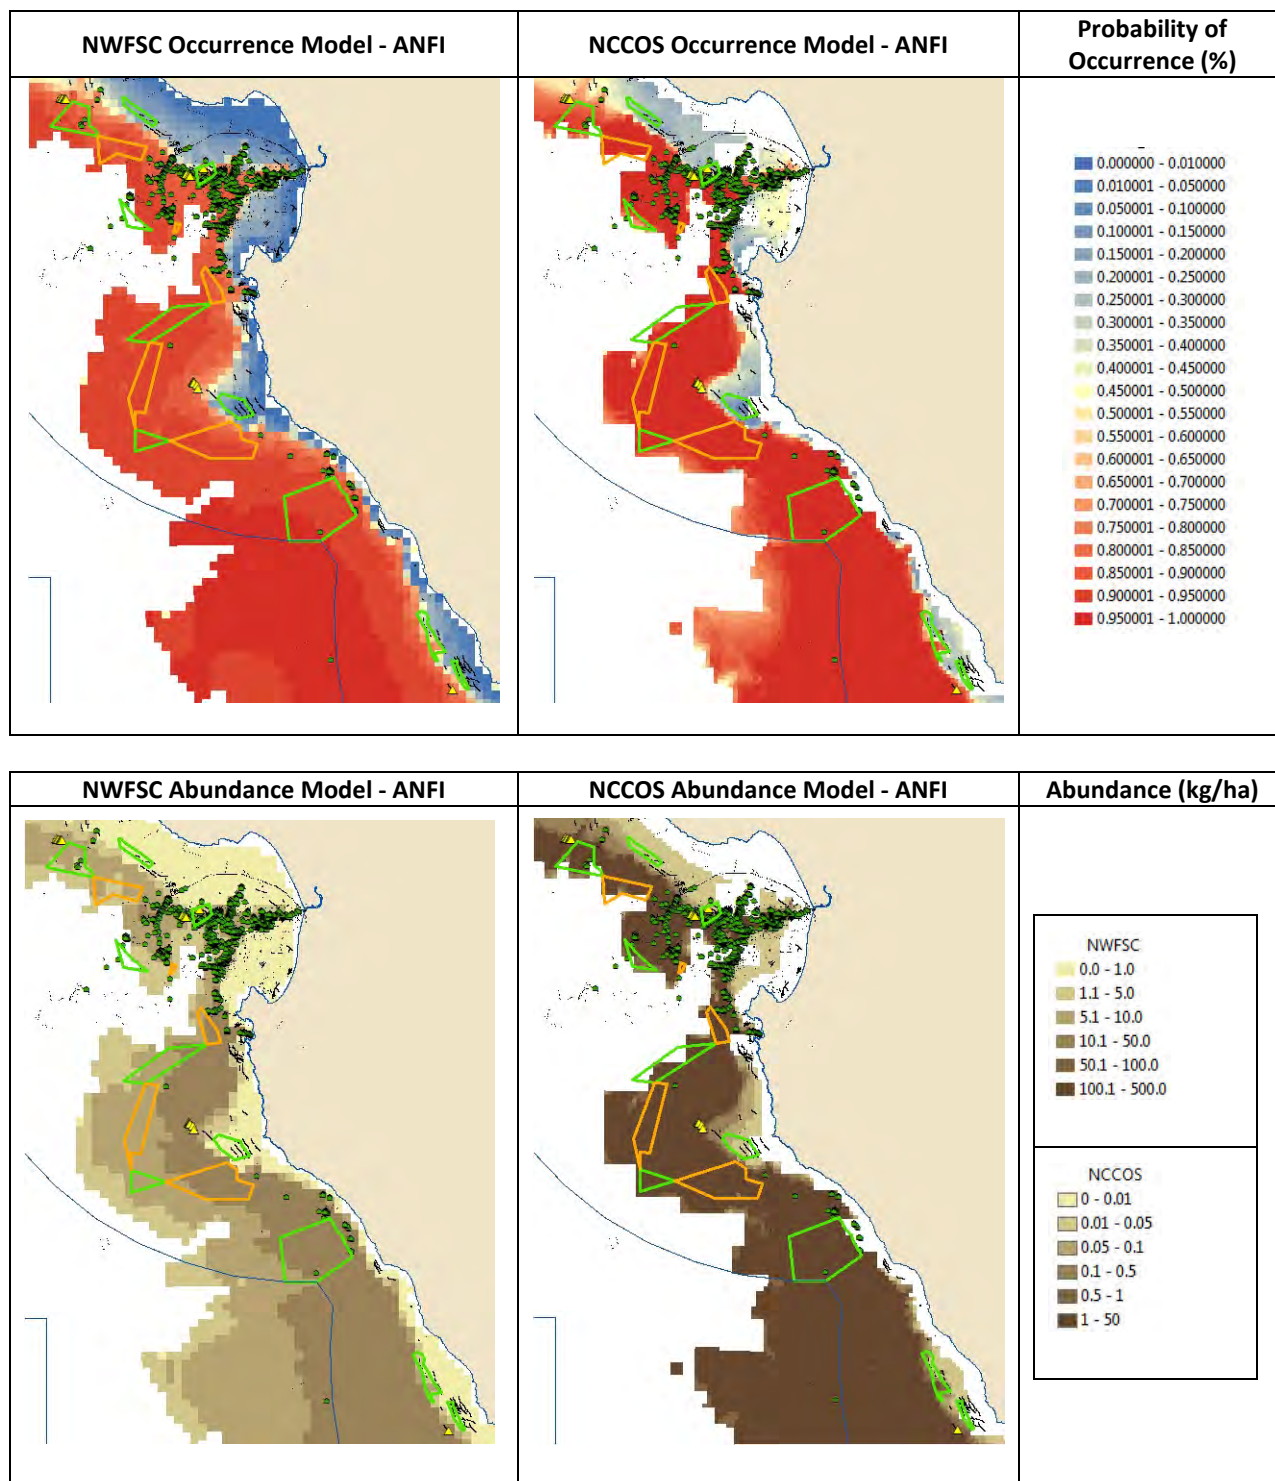

Greenstriped Rockfish (*Sebastes elongates*, SEEL)

Greenstriped RF prefer mixed hard and soft substrates in proximity to rocky outcrops within a moderate depth range of 100-250 m but are most common and abundant North of Monterey Bay. MBARI's in situ observations of Greenstriped RF (green dots) do align with the highest quality habitat predicted by the models except for the NCCOS abundance model. MBARI effort shown in black.

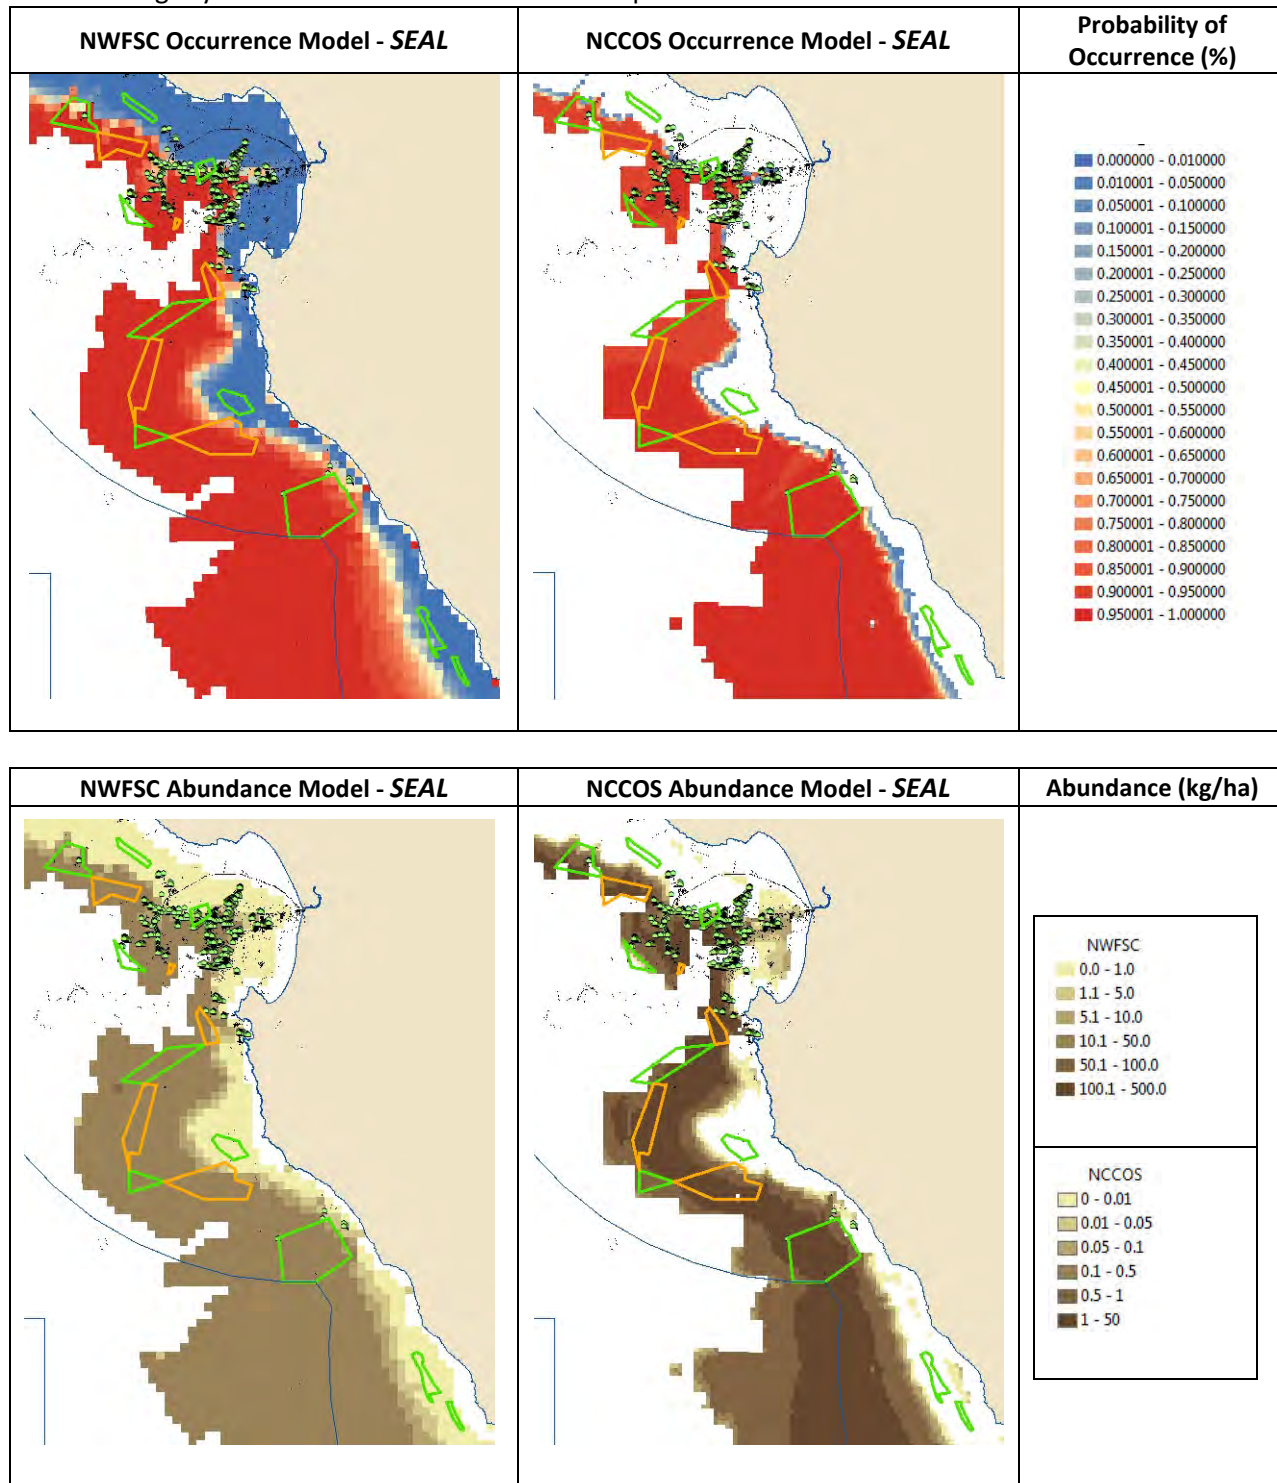

Sablefish (*Anoplopoma fimbria*, ANFI)

Sablefish are widespread and associated with soft slope habitats. NCCOS and NWFSC models have accurately predicted appropriate habitat as verified by the in-situ observations by CSUMB (yellow triangles) but sablefish have been observed in canyon habitat by MBARI (green dots) in addition to the modeled high suitability habitat. MBARI effort and CSUMB effort are shown in black.

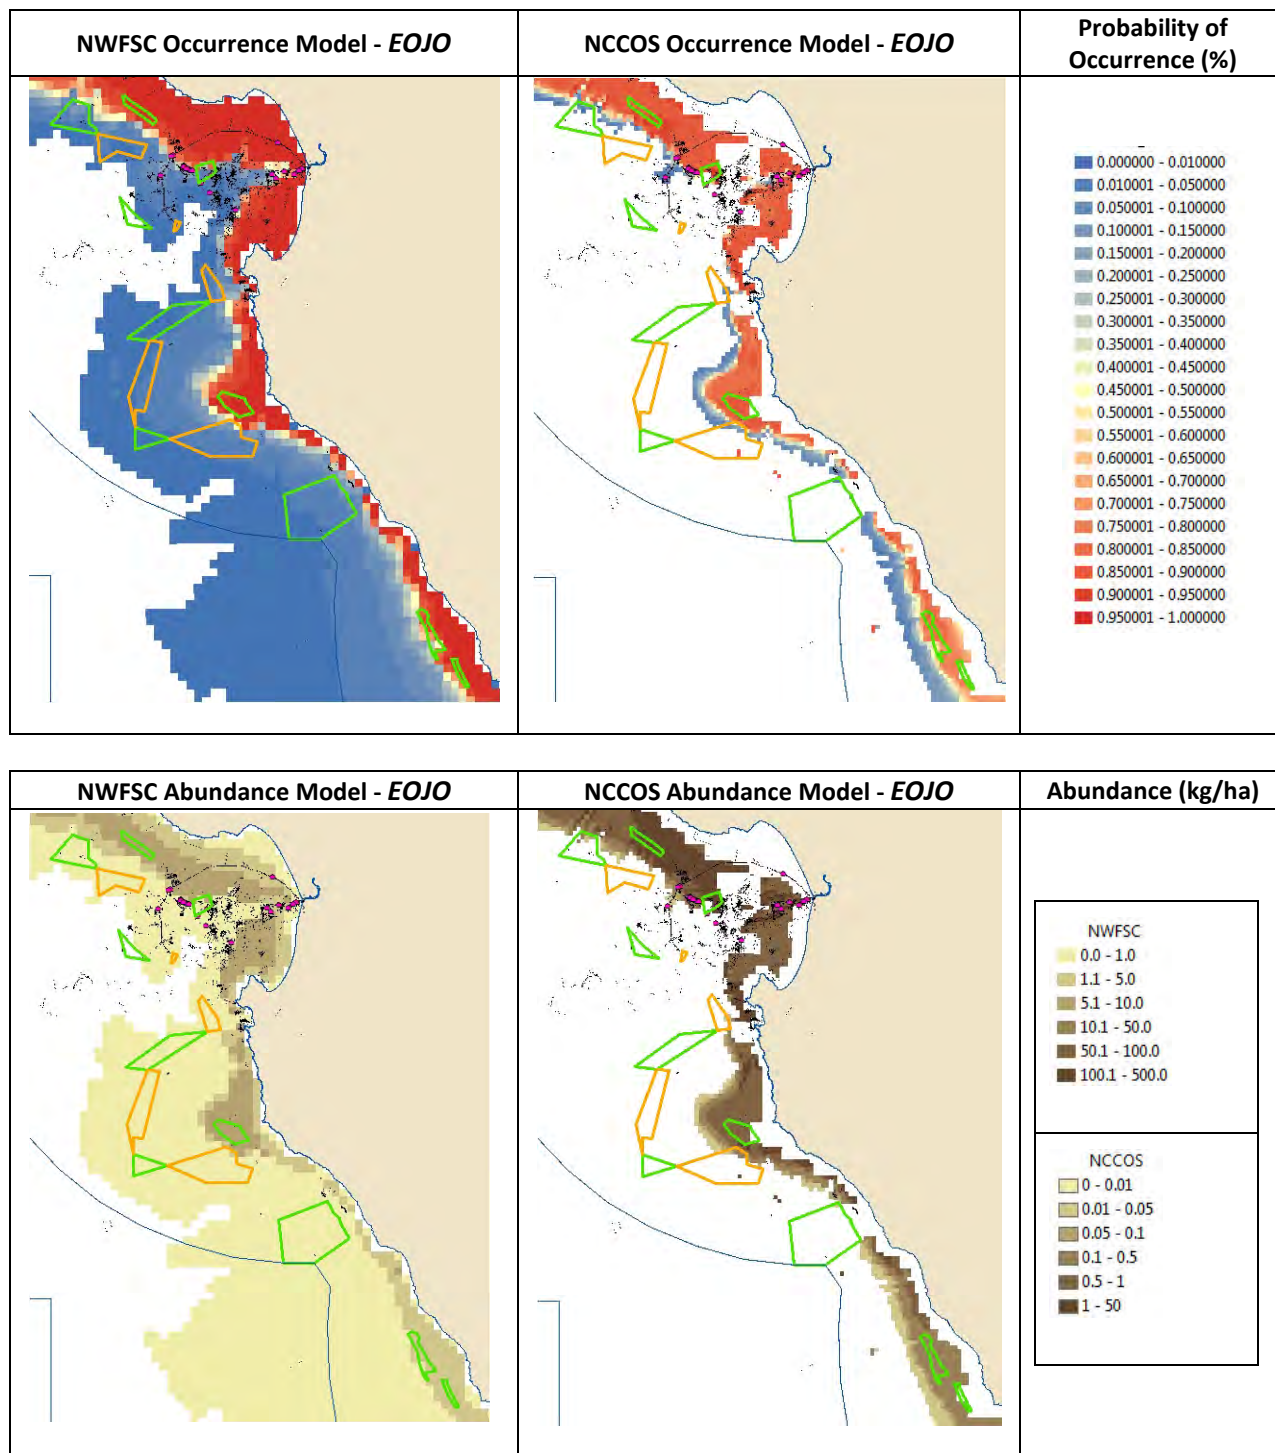

Longspine Thornyhead (*Sebastolobus altivelis*, SEAL)

Longspine Thornyhead's preferred benthic habitat is soft slope. Depth and temperature were important predictors in both models. MBARI in situ observations (light green dots) suggest that many fish are also found in slightly shallower waters than the models predict. MBARI effort shown in black.

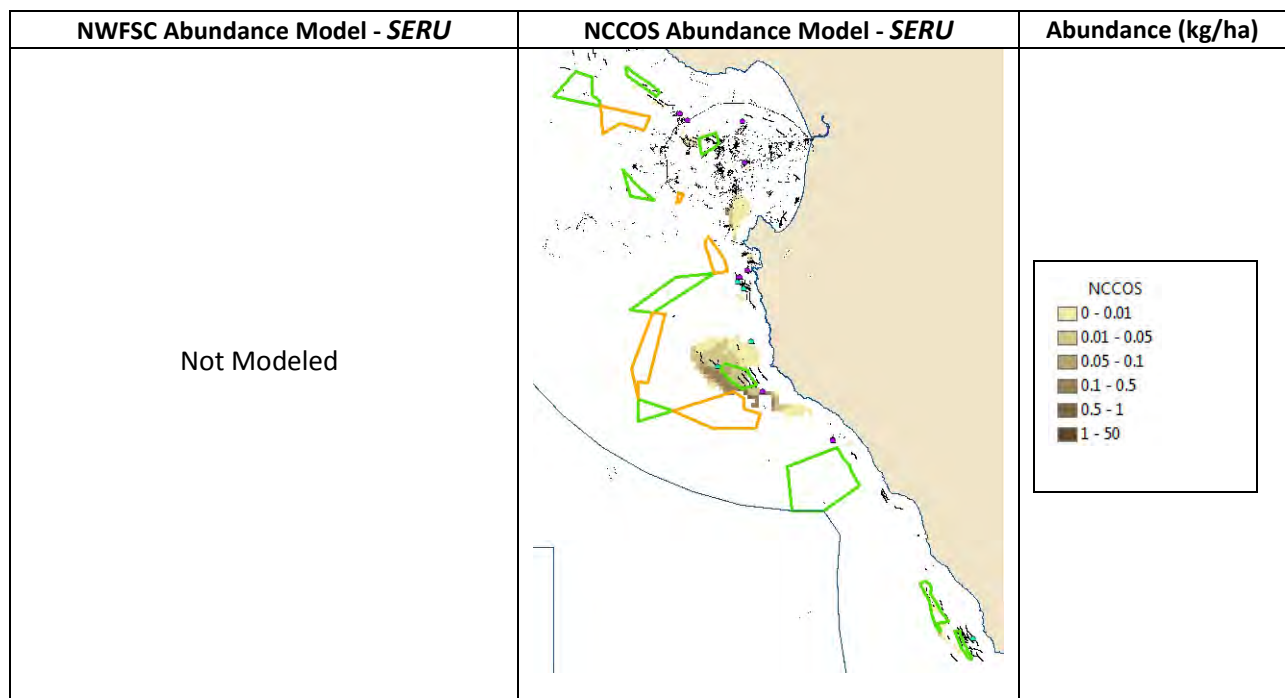

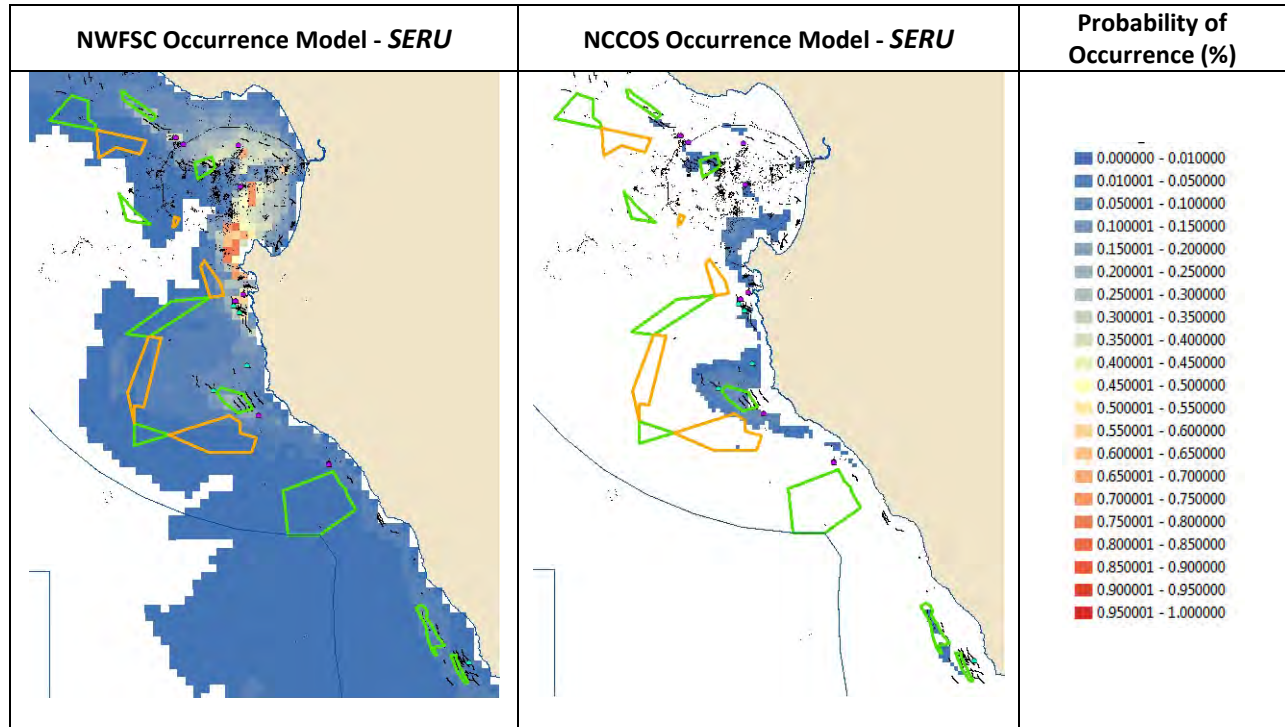

Petrale Sole (*Eopsetta jordani*, EOJO)

Petrale Sole is an abundant shelf species utilizing soft sediment. Monterey Bay and Point Sur were predicted catch hotspots in the abundance models. MBARI in situ observations (pink dots) suggest that many fish are found in slightly deeper waters than the models predict. The MBARI effort shown in black.

Yelloweye Rockfish (*Sebastes ruberrimus*, *SERU*)

Yelloweye RF are found in rocky bottoms with steep outcrops. NCCOS and NWFSC models are unreliable predictors of habitat quality for *SERU* because rocky habitat was not sampled well by trawl surveys but the NWFSC model did include in-situ data. Yelloweye were observed by MBARI (pink dots) and CSUMB (green dots) in the medium probability grids of the NWFSC occurrence model within Monterey Bay.

APPENDIX C: DESCRIPTIONS OF ADDITIONAL DATA SOURCES USED IN ADDITION TO NMFS NEW DATA

MBARI VARS DATABASE

MBARI uses high-resolution video equipment to record more than 300 remotely operated vehicle (ROV) dives per year. In MBARI's 24 years of ROV diving (1989-present), well over 16,000 hours of videotapes have been archived, annotated, and maintained as a centralized institutional resource. This video library contains detailed footage of the biological, chemical, geological, and physical aspects of the Monterey Bay submarine canyon and other areas including the Pacific Northwest, Northern California, Hawaii, and the Gulf of California. MBARI has developed the Video Annotation and Reference System (VARs), consisting of software and hardware to facilitate the creation, storage, and retrieval of video annotation records from the ROV dive tapes.

The VARs Query is a software tool, developed to enable easy access to information from MBARI's video annotation database. Complex queries can be made by constraining temporal, spatial, or physical parameters (for example: season, location, or depth). The VARs Query references the knowledge base. Using the query tool, users can identify the location of video sequences or access other information recorded during ROV research dives. The public can run queries on VARs but the most recent data is embargoed for two years so that MBARI scientist have an opportunity to publish any research based on the ROV data first. The groundfish query results were run internally by MBARI staff and are thus the most up-to-date data.

The VARs database provides invaluable qualitative and quantitative data that have been used in hundreds of peer-reviewed publications. Some examples can be viewed here:

<http://www.mbari.org/vars/VARSPublications.htm><http://www.mbari.org/vars/VARSPublications.htm>

The VARs query was run for the following species (the 6 species modeled by both NWFSC and NCCOS and the additional 6 species modeled by NCCOS):

Darkblotched Rockfish (*Sebastes crameri*)

Yelloweye Rockfish (*Sebastes ruberrimus*) (None in MBNMS EFH proposed areas)

Sablefish (*Anoplopoma fimbria*)

Longspine Thornyhead (*Sebastolobus altivelis*)

Greenstripe Rockfish (*Sebastes elongatus*)

Petrale Sole (*Eopsetta jordani*)

Dover Sole (*Microstomus pacificus*)

Lingcod (*Ophiodon elongatus*)

Pacific Ocean Perch (*Sebastes alascanus*) (None in database)

Shortspine Thornyhead (*Sebastolobus alascanus*) (None in MBNMS EFH proposed areas)

Chilipepper Rockfish (*Sebastes goodei*) (None in MBNMS EFH proposed areas)

Sebastolobus complex

<http://www.mbari.org/vars/VARSPublications.htm>

CALIFORNIA STATE UNIVERSITY MONTEREY BAY'S INSTITUTE FOR APPLIED MARINE ECOLOGY (IfAME)

In June 2007, the Institute for Applied Marine Ecology (IfAME) began a partnership with the Monterey Bay National Marine Sanctuary to form a cooperative research effort utilizing a towed video camera sled to characterize the continental shelf within the Sanctuary. Characterization of resources on the shelf is a major goal of the Sanctuary Management Plan, a document guiding the understanding and management of the resources within the Sanctuary boundaries. This partnership has facilitated both Bachelor's and Master's Thesis projects that seek to answer ecological and technological questions that will inform Federal and State marine management agencies. In June 2009, the objectives of the partnership expanded to also focus on characterization of the Sanctuary's deepwater resources (deeper than 250 meters) and the use of a remotely operated vehicle (ROV) was employed. A summary of the partnership's efforts over the four-year period from 2007-2010 is available in the recent publication IfAME & MBNMS (2011). In addition, a project summary is available on the Sanctuary Integrated Monitoring Network website: <http://www.sanctuarysimon.org/projects/100373/deepwater-characterization-and-baseline-monitoring-in-the-monterey-bay-national-marine-sanctuary>

ROV

A remotely operated vehicle (ROV) is used to collect videographic and still photographic imagery of the seafloor and associated organisms at these locations throughout the Sanctuary. The ROV (owned by The Nature Conservancy and operated by Marine Applied Research and Exploration) is equipped with both forward- and down-looking digital still and video cameras.

Camera Sled

The collection of video imagery is also conducted using a towed-camera sled configured with a single forward-facing video camera. In 2006, MBNMS utilized a small (125 lb) video-sled (51" long x 16" wide x 20" high) to tow underwater behind the NOAA research vessel *Shearwater* to film and document habitats and life over several areas of the continental shelf, specifically areas close to the Monterey Peninsula and the Point Sur shelf. Seafloor descriptions were recorded by scientists and trained observers every 30 seconds during real-time observations of the seafloor. All fauna was identified to the lowest possible taxonomic level, sizes were estimated and select habitat and microhabitat features and associations across a gradient of benthic habitats were noted. Producing archived video records with comprehensive data compilation allows evaluation of all community components to identify those which are most appropriate for long-term monitoring to achieve the goals identified by the MBNMS (DeMarignac, J., King, C. (2006)). The data became part of the IfAME program and partnership with CSUMB, and the camera sled was used as a method of data collection from 2006 to 2011.

CSUMB has analyzed video collected with the TNC/MARe ROV and the MBNMS camera sled for locations of invertebrates, groundfish, and groundfish complexes or guilds. For the purposes of this proposal, we combined the data from the two survey tools for either biogenic or groundfish observations.

Access Database

IfAME staff built an Access database containing data from approximately 45 hours of ROV video and 150 hours of towed camera sled video, collected from 2007-2012 in the Monterey Bay National Marine Sanctuary. These data have been analyzed for fishes and select invertebrates. Organisms are identified to the lowest taxonomic level possible, which in many cases is just to genus or species complex rather than

species. This is due to many factors including visibility at depth, vehicle lighting and organism position relative to the video camera. Observations collected from video are input into an Access database and associated with tracking data collected at-sea via the time and date field. The database is constantly updated and expanded as more video is collected and analyzed and QA/QC'd. Database query results include the organism or complex of interest, count, and associated latitude and longitude coordinates. Queries were run for (those shown in bold below were seen in the MBNMS proposed EFH areas and the total counts of the fish or invertebrates are indicated in the groundfish observation or biogenic components tables for each area in the main body of the proposal):

Boccacio
Canary/Vermillion/Yelloweye Rockfish complex
Canary Rockfish
Yelloweye Rockfish
Petrable Sole
Lingcod
Sablefish
Greenstriped Rockfish
Young of the Year (YOY)
Darkblotched Rockfish (None seen yet)
Widow Rockfish (None Identified to species yet)
Pacific Ocean Perch (None seen yet)
Dover Sole (None in MBNMS proposed EFH areas)
Chillipepper (None in MBNMS proposed EFH areas)
Shortspine Thornyhead: Included in the file under "Sebastolobus" (None in MBNMS proposed EFH areas)
Longspine Thornyhead: Included in the file under "Sebastolobus" (None in MBNMS proposed EFH areas)
Halibut (None in MBNMS proposed EFH areas)
Corals (None in MBNMS proposed EFH areas)
Seapens and Seawhips
Sponges (>10 cm)

Regarding effort, MBARI's research has focused on and around Monterey Canyon but they have also completed transects within Areas 1, 2, 4, 5, 7, 12, and 13. CSUMB has completed transects within Area 2, 4, 12, 14, and 15. Both research institutions have the most overlap in Area 4. There has been absolutely no effort by either institution in Area 3, 6, 8, 9, 10, or 11 and a very, very limited amount in Area 7 and 13.

USGS 2000

"Seafloor Rocks and Sediments of the Continental Shelf From Monterey Bay to Point Sur, California (2000)" by Stephen L. Eittreim, Roberto J. Anima, Andrew J. Stevenson, and Florence L. Wong

This data is shown as the substrate layer for Point Sur Platform HAPC "Area of Interest" because it contains a more accurate representation of the bottom types in this area as verified by images and video from ROV surveys by CSUMB and fishermen's knowledge.

USGS 2000 data represents the acoustic swath mapping of the greater Monterey Bay area continental shelf from Point Año Nuevo to Point Sur, which reveals complex patterns of rock outcrops on the shelf, and coarse sand bodies that occur in distinct depressions on the inner and mid-shelves. This publication portrays the seafloor at 1:100,000 scale. The digital database for the interpreted geology and other digital files are available from:

<http://pubs.usgs.gov/mf/2000/2345/>

Geographic Information Systems (GIS) Methods

MBNMS GIS staff have been crucial to analyzing many data sets, both from NMFS and from other organization. Constant modification and refinement of proposed polygons “on-the-fly” in meetings with stakeholders, as well as more detailed edits have bore fruits of understanding within the broad and diverse working group, including the development of an internal interactive map that provided the group with most of the data sets for individual review and consumption, whenever it was convenient for each person. Below are described methods for various GIS processes that resulted in data cited in this proposal.

Summary Statistics of Proposed EFH Modified Boundaries

To better understand the breakdown of total area by a number of attributes, GIS was used to summarize these statistics in a meaningful way to the group. In all GIS processes, ArcGIS 10.1 was used (with an ArcINFO and Spatial Analyst license, Environmental Systems Research Institute. ArcGIS Version 10.1. Redlands, CA:). A shapefile of all 15 polygons representing the proposed EFH modifications (Monterey Bay National Marine Sanctuary. 2013. Proposed EFH Boundary Modifications.

MBNMS_EFH_Options_final_071213.shp (shapefile geospatial data). July 12, 2013.) was used in all summaries. Attributes summarized include depth in meters and fathoms (mean, minimum, maximum, median, range, and standard deviation), percent slope (mean, minimum, maximum, median, range, and standard deviation), depth zone (shelf: 30 - 100 meters, shelf break: 100 - 300 meters, slope 1: 300 - 800 meters, slope 2: 800 - 3,000 meters), substrate type (hard or soft), and if an area was classified as being in a canyon or not. Shannon-Wiener diversity index (H') was also calculated as a way to calculate “habitat diversity” within each polygon.

Depth and Percent Slope Summaries

The ArcToolBox function, “Zonal Statistics as Table (Spatial Analyst)” was used to summarize a raster grid of depth (Decimeters Bathymetry Grid. Sacramento, CA: California Department of Fish and Game, 2000.) and a raster of percent slope (Percent Slope Grid. Monterey, CA: Monterey Bay National Marine Sanctuary, 2013.) by each polygon. This tool summarizes the values of a raster within the zones of another dataset and reports the results to a table. The summary attributes include the mean, min, max, median, and standard deviation of the values of the raster grid.

Substrate Type Summaries

Depth classes, which were binned into categories by depth from a raster grid (Decimeters Bathymetry Grid. Sacramento, CA: California Department of Fish and Game, 2000.), substrate type and canyon classification (Physical Seafloor Characteristics of the Continental Margin of the United States West Coast. Seattle, WA. National Marine Fisheries Service Northwest Region. 2004.) were merged into one shapefile (Habitat Diversity. Monterey, CA. Monterey Bay National Marine Sanctuary. 2013.). This file was then clipped by the Proposed EFH Boundary Modifications shapefile and all attributes from habitat diversity assigned to it. Area calculations were then made in ArcGIS with the “calculate geometry” tool. The resulting shapefile was exported as a table, which then pivot tables were generated with Microsoft Excel to summarize area by polygon, EFH modification type, depth class, and substrate type.

Shannon-Wiener Diversity Index (H')

As a measure of habitat class “diversity,” the Shannon-Wiener diversity index was used, based on total area by each of 11 possible habitat classes.

$$H' = - \sum_{i=1}^R p_i \ln p_i$$

H' was calculated using the equation:

To step through this equation, area was calculated for each habitat class in each of the 15 polygons from the Proposed EFH Boundary Modification shapefile. The resulting table was imported into Microsoft Excel. Relative representation of habitat (percentage of polygon total area) within each polygon was calculated (pi). The natural log of pi was calculated using the Excel command, “LN=(cell n).” The product of the natural log of pi and pi were then summed into final values, higher of which indicate a high and balanced proportion of richness of habitat classes.

APPENDIX D: SANCTUARY ECOLOGICALLY SIGNIFICANT AREAS AS A BASIS FOR IDENTIFYING AREAS FOR GROUNDFISH EFH HABITAT PROTECTION

As part of its' ecosystem based management approach, over the past two years, MBNMS has worked with many partners to establish Sanctuary Ecologically Significant Areas (SESAs). These special areas encompass remarkable, representative and/or sensitive marine habitats, communities and ecological processes. They are focal areas for facilitating research to better understand natural and human-caused variation. SESAs are not currently part of the MBNMS regulatory regime, yet may be used and applied as a resource management tool. SESAs are located in offshore Federal waters, including portions of MBNMS to the west of state waters, and the Davidson Seamount Management Zone. They are currently focused on benthic habitats, yet may be expanded to include pelagic habitats.

The 16 SESAs will support the following management needs:

1. Detailed information on focal areas improves the agency's ability to adaptively manage resources, and serves as test cases for other areas within MBNMS. The information served as a basis for MBNMS' initial selection of ecologically sensitive habitat to protect under this process (PFMC 5-yr Review of Groundfish Essential Fish Habitat), and future issues are anticipated for applying the SESA information including offshore energy development, offshore aquaculture, oil spills, shipping lanes, noise or climate change.
2. Targeting research and monitoring efforts in focal areas and coordinating with the scientific community. Findings from focal areas may be extrapolated to other areas within MBNMS, guiding future management decisions and policy. A research symposium or series of workshops will be held later in the year with the scientific community.
3. Applied spatial management tools (such as SESAs) are needed to effectively measure and evaluate protection levels in ecologically important and sensitive habitats in preparation for the upcoming management plan review process.

During the development process, MBNMS worked with the scientists, fishermen, conservation NGOs, and other agencies to collect and evaluate hundreds of layers of spatial data as well as non-spatial data. Primary and secondary criteria were identified to select areas that address multiple objectives. Primary criteria include benthic habitat identified by depth zones, substrate type, benthic structure-forming invertebrates (e.g., DSC and sponges) and locations where visual or research data had been collected. Secondary criteria include upwelling hotspots, visual imagery, stakeholder input and existing management connections. The selection process consisted of the following steps:

1. Defined SESAs and their primary objectives.
2. Compiled and synthesized the best available information.
3. Selected primary and secondary criteria, and modified based on stakeholder input. Primary criteria focused on benthic resources and/or scientific research and are directly related to the SESA definition and objectives. Secondary criteria focused on persistent pelagic features or processes, spatial management, and benthic impacts and were used to refine SESA boundaries because they influence the ecology and/or management in these areas. (see link: <http://sanctuarysimon.org/maps/sesa/SESAsPublicMatrix073013.pdf>.)
4. Identified draft SESA locations using input from staff and stakeholders; requested input on missing data or information, created draft SESA map and circulated to stakeholders.

5. Launched a public GIS on-line map, an outreach tool for the Sanctuary Advisory Council and others (<http://sanctuarysimon.org/maps/sesa/>)
6. Finalized a comprehensive package of 16 SESA in June 2013.

In summary, the SESA process has helped MBNMS staff to identify a suite of areas with a diversity of benthic habitat types and associated biological communities that will be the focus of targeted resource management and research efforts. The analysis, including review of photo and video imagery from specific locations, revealed that some of these areas contain benthic habitats and communities that are very sensitive to bottom trawling and are currently vulnerable to this activity. Through engagement in the EFH review process, the sanctuary seeks to reduce the vulnerability of some of these areas through new EFH conservation areas, trawling regulations, and voluntary management areas. Lastly, if a proposed EFH area overlaps with a SESA, we will identify if the presence of unique, and/or rare habitat is included in the proposed area, and provide the SESA identification number.

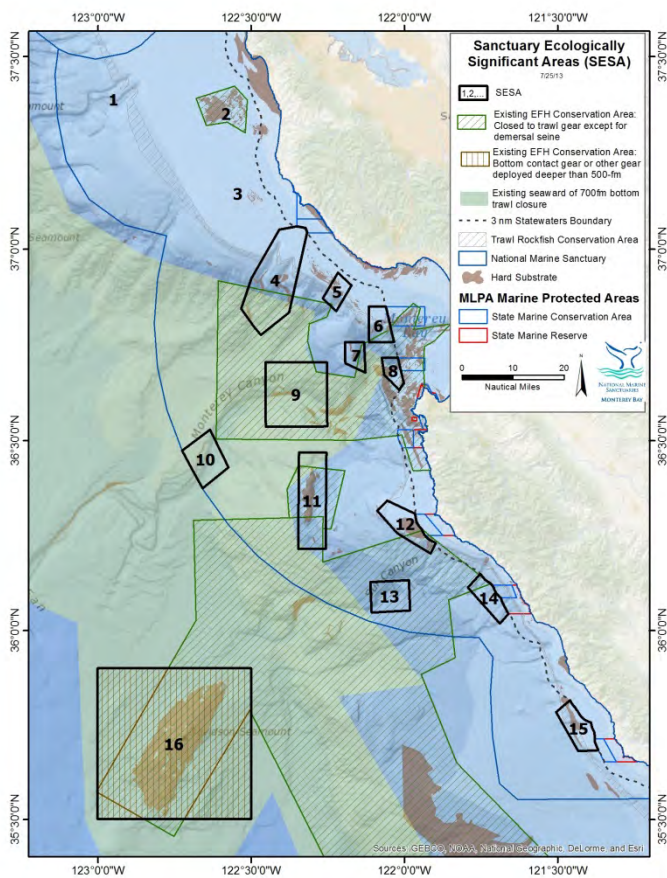

Figure 1: Map of Sanctuary Ecologically Significant Areas and overlap with existing Groundfish EFH Conservation Areas & 700 Fathom Bottom Trawl Footprint Closure status quo.

RE: Support for Regional Modifications to Groundfish Essential Fish Habitat Boundaries as Proposed by the Monterey Bay NMS as the Lead Agency, and Stakeholders

Dear Mr. Griffin,

The Alliance of Communities for Sustainable Fisheries (ACSF) is a twelve-year old 501-c-3 not-for-profit educational organization, founded for the purposes of connecting fishermen with their communities, and to represent fishing interests in state and federal processes. The ACSF is a regional organization, with commercial fishing leader representatives from Port San Luis, and Monterey, Moss Landing, Santa Cruz, and Pillar Point harbors on our Board of Directors. Port communities and several recreational fishing organizations also are represented on our Board. Thus, the ACSF represents a large cross-section of fishing and community interests for the central coast of California.

The ACSF and its individual fishermen have been directly involved in several past processes led by the Monterey Bay National Marine Sanctuary (MBNMS) that have studied or proposed additional marine protected areas (MPAs) in state and federal waters. For us, the context of these efforts is the understanding put into place when the MBNMS was created (and reflected in the Sanctuary's Designation document) that the new Sanctuary would not regulate fisheries, or take actions that threaten the livelihoods of fishermen. If the Sanctuary expressed concerns about a fishing-related issue, we would work together to identify a mutually supportable solution. The ACSF participated constructively, but for various reasons ultimately was not able to support the MBNMS process proposed, or in some cases the specific area closures, for these past efforts.

In this case at hand, the PFMC's review of existing groundfish Essential Fish Habitat closures, MBNMS staff led by Superintendent Paul Michel, engaged the central coast's bottom trawl fishermen early-on to establish relationships, and trust. Fishermen were assured that they would have a meaningful say in any proposal that developed to modify EFH boundaries, and that they might directly benefit by possible recommendations to reopen some areas of economic importance to fishing. Several environmental organizations also participated in these discussions, with the outcome being a heavily negotiated set of trade-offs for recommendations

to close some new areas to bottom trawling, combined with reopening other areas. The ACSF and its members directly participated in this process, and **we support the recommendations made in the proposal**. Because this proposal was the end result of several rounds of negotiations, we ask that it be considered as a whole.

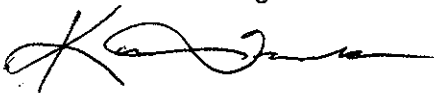

There were some preliminary discussions about recommending closing some areas of the RCA for the purpose of the possible reopening other RCA areas (as opposed to identifying the habitat concern of the EFH process). However, the ACSF does not support those proposals at this time without a collaborative effort that would include thorough scientific data analysis and socioeconomic evaluation of the areas.

ACSF participating members were able to contribute log data on catches from prior to EFH closure, which has been used to provide fine scale data on the economic (with accompanying community) benefits, should these areas be reopened. We also note that even a cursory look at a map of areas that are closed to some or all kinds of fishing in the central coast reveals that not a lot of fishing opportunity currently exists. The City of Monterey, which has long supported the MBNMS and the ACSF, paid for the analysis of this data, to assure that decision-makers had accurate economic information.

The proposal also includes some non-regulatory areas that fishermen have volunteered to avoid, and some suggestions for monitoring fishing gear for enforcement purposes.

It should be noted that our support is limited to closure of the new areas only for bottom trawling, and is not intended to suggest broader closures for other bottom-contacting gears, including recreational gears. Our support is also limited to the area south of Año Nuevo point, and north of Cambria, inside the MBNMS boundary. Although there was some discussion of EFH boundary adjustments that might be proposed by the Gulf of the Farallones and/or Cordell Bank NMS's north of Año Nuevo, the ACSF **does not** support these proposals. It is felt that sufficient outreach to those who might be affected had not occurred or was rushed, that there was not much seen in the early discussions that would benefit fishermen, and that there was little compelling scientific evidence that these areas are essential for the success of groundfish.

Thank you for accepting our support and consideration of this proposal for regional modifications to groundfish EFH boundaries.

RE: Support for Regional Modifications to Groundfish Essential Fish Habitat Boundaries as Proposed by the Monterey Bay NMS as the Lead Agency, and Stakeholders

Dear Mr. Griffin,

The City of Monterey is pleased to voice its support for the regional modifications to Groundfish Essential Fish Habitat (EFH) boundaries as proposed by the Monterey Bay National Marine Sanctuary (MBNMS) as the lead agency, fishermen, and several environmental organizations.

Given the understanding that was put into place before the Monterey Sanctuary was created, that the new sanctuary would not regulate fisheries or otherwise threaten their livelihoods, and that "traditional fishing practices" would continue to be allowed, the City adopted the following policy guidance for MBNMS actions:

"Any zones or regulations proposed by the Sanctuary which affect fishing would occur only if they are the result of a cooperative effort with fishing and aquaculture communities and they have the support of those communities"

Fishing remains an important economic and cultural feature of the City. Groundfish is one of the cornerstone fisheries that support fishing infrastructure. Fishing activity also is a powerful factor in the City's robust visitor-serving economy. Currently about 64% of the very large MBNMS is closed to bottom trawling; this proposal actually selectively increases that amount.

The City of Monterey's Harbormaster participated in all discussions of creating several EFH boundary recommendations to the Pacific Fishery Management Council (PFMC). This proposal would protect certain areas of coral and sponges from bottom trawling, while also recommending that some areas currently closed to trawling as EFH be reopened, thereby restoring some economically important fishing grounds. The City's support is limited to the MBNMS area south of Ano Nuevo to Cambria. All of the likely affected fishermen are supporting this trade-off, as are several large environmental organizations. The City congratulates the MBNMS on this negotiation, and we hope that the PFMC and its review committees will support the recommendations, unchanged.

Thank you for considering the support of the City of Monterey.

Sincerely,

for Nancy Selfridge Vice Mayor
Chuck Della Sala
Mayor

RE: Letter of Support for the Collaborative Groundfish EFH Proposal: Protecting Essential Fish Habitat While Balancing Fishing Opportunities in Monterey Bay National Marine Sanctuary, South of Año Nuevo

Dear Mr. Griffin,

The California Risk Pool – a partnership among the Fort Bragg Groundfish Association, the Half Moon Bay Groundfish Marketing Association, the Central California Seafood Marketing Association and The Nature Conservancy – is writing to support the above proposal to modify Pacific Coast Groundfish Essential Fish Habitat which is being submitted by Monterey Bay National Marine Sanctuary as the lead agency on behalf of the collaborating organizations.

Along with the other partners participating in this effort, we believe that regional collaboration is useful to develop a fully informed and comprehensive package of Essential Fish Habitat (EFH) boundary modifications. This approach utilizes local knowledge from all stakeholders and enables agencies, fishermen, and environmental NGOs to bring their expertise and knowledge together to solve complex coastal policy decisions.

This proposal will seek to add some new closures to protect critical groundfish EFH habitat as well as re-open some areas to restore key historically trawled areas of importance to trawl fishermen. In addition, the proposal will put forward concepts on voluntary management areas, and changes to enforcement of spatial closures.

The California Risk Pool has operated for the past three years with the purpose of promoting best practices and innovations within the groundfish fishery in order to help preserve traditional California fishing ports, fishery jobs, and the marine resources this industry depends on. Through this partnership, we have been able to break through the long held barriers to productive working relationships between conservation and fishery industry stakeholders, and have collaborated on a harvest model aimed at targeting

healthy, abundant stocks while avoiding vulnerable overfished species and sensitive habitat. While it has taken nearly four years of hard work and continued learning, we are now seeing firsthand the value of true collaboration and its potential to help reform our fisheries to achieve better economic, social, and environmental performance.

The MBNMS conducted an effective and collaborative process working with the local fishing industry and other stakeholders to arrive at this EFH proposal. The CRP has commended the MBNMS staff in finding “win-wins” for improving the configuration of EFH within the MBNMS that has resulted in a proposal for both the return of important traditional fishing grounds and the protection of key habitats that will provide long-term fishery productivity and other ecosystem benefits.

We appreciate this opportunity to express our support for the proposal being submitted by MBNMS on our behalf. Thank you for considering this proposal.

Sincerely,

Michelle Norvell
Executive Director, Fort Bragg Groundfish Association

Jon Griesser
Executive Director, Central California Seafood Marketing Association

Lisa Damrosch

RE: Letter of Support for the Collaborative Groundfish EFH Proposal: Protecting Essential Fish Habitat While Balancing Fishing Opportunities in Monterey Bay National Marine Sanctuary

Dear Mr. Griffin,

On behalf of Environmental Defense Fund, I am writing to support the above proposal to modify measures to protect Essential Fish Habitat (EFH) for Pacific groundfish. While this proposal is being submitted by the Sanctuary, it reflects the work of a broad collaboration including local fishermen and environmental groups.

We commend the Sanctuary on working hard to help us develop a proposal that is both a win for conservation as well as the local trawl fishermen. The proposal re-opens some important fishing grounds that were lost in the original designation of EFH, helping a small but important segment of the Central Coast's groundfish fleet. However, it also closes significant amounts of rocky habitat that are less fished but have greater sensitivity to trawl impacts.

We have been closely engaged with the implementation of the trawl catch share program and we are excited about its conservation and economic benefits. At the same time however, we are aware of the costs to the fleet and to NOAA. We have been working hard with our partners on a range of measures to reduce those costs and increase opportunity. We engaged in the EFH process with the belief that if there were to be any changes, they needed to be made in the context of this overall cost-benefit structure and should advance catch share performance as a whole. We believe that additional closures should not be created without fishery support at this critical stage, and should be offset by openings where appropriate to facilitate access to target stocks. Because this proposal does this and **it has the unified support of local trawl fishermen**, we are pleased to support it.

We would like to note that the boundaries included in the proposal were highly negotiated. While the EFH Review Committee and the Council have the ability to redraw them, we caution against this as even minor adjustments may affect the support of the stakeholders involved.

We believe that this kind of collaboration is critical to the effective use of closed areas. It allows for the identification and protection of habitats and populations while securing access to target stocks. It also helps set the stage for similar work to identify areas of the Rockfish Conservation Area that should be opened where fishermen can fish cleanly, and areas that may be better suited to permanent closure to protect important habitat values.

We appreciate the opportunity to express our support for this proposal and to participate in the EFH process. Thank you for your consideration.

Sincerely,

Portland, OR 97220-1384

Re: Support for Monterey Bay National Marine Sanctuary Proposal for Revisions to Groundfish Essential Fish Habitat Regulations

Dear Chairman Wolford and Members of the Council:

We write on behalf of our respective organizations to express general support for the proposal to revise Groundfish Essential Fish Habitat (EFH) regulations being submitted by the Monterey Bay National Marine Sanctuary (MBNMS) in response to the Council's Request For Proposals.

As conservation organizations involved in the initial EFH regulations implemented in 2006, we are engaging with the Pacific Fishery Management Council's EFH 5-year review process with the goal of improving and refining habitat protections for groundfish off the West Coast, and we are separately submitting a comprehensive coastwide proposal. We believe EFH protections can be achieved while also maintaining vibrant fisheries, and our participation in the Council's EFH 5-year review process is oriented around the dual vision of healthy marine ecosystems and successful fishing fleets.

As the Council is aware, the Magnuson-Stevens Act requires all Fishery Management Plans to "describe and identify essential fish habitat," and to "minimize to the extent practicable adverse effects on such habitat caused by fishing." 16 U.S.C. § 1853(a)(7). The 5-year review process is an important tool for incorporating new information into EFH regulations and improving habitat protection. See 50 C.F.R. § 600.815(a)(10).

Bearing in mind the ongoing habitat protection mandate in the Magnuson-Stevens Act based on best available scientific information, we believe there is room in the 5-year review process for revisions to EFH regulations that yield improved fishing opportunity, but such revisions must be consistent with maintained or improved habitat protection. Specifically, we believe re-opening areas to fishing impacts

is only appropriate under the law if (1) location-specific scientific evidence demonstrates conclusively that re-opening the area will not result in habitat damage, or (2) the re-opening comes in the context of an overall package of revisions that will yield a strong net increase in habitat protection. Areas that are currently closed are clearly “practicable” under the law, and therefore must remain closed unless an opportunity arises to achieve higher levels of protection by opening them. 16 U.S.C. § 1853(a)(7). In this situation, new protections must significantly outweigh the conservation value of the re-opened area(s) because the existing closure—by virtue of the passage of time—has created conservation value by stabilizing the ecosystem and allowing it to recover from fishing impacts.

In the MBNMS proposal, several areas are proposed for re-opening to trawling. We are able to support these areas for the second reason noted above—that is, in this case the overall package submitted by MBNMS results in substantially improved habitat protection for the Monterey Bay region. Of particular note are the proposed new closures at the Point Sur platform and Ascension Canyon, as well as several new areas that encompass significant documented biogenic habitat such as corals and sponges. Across multiple habitat indicators, the proposal results in substantially more protection. For example, the net changes in habitat protection include more total area in the region, more known coral and sponge records and locations, and more hard substrate. We believe the net result of the MBNMS proposal in the Monterey Bay region represents an improvement for both conservation and fishing opportunity, and that the changes contained in the proposal are consistent with the legal mandate for habitat protection contained in the Magnuson-Stevens Act.

Note that the discussion above focuses on the Monterey Bay region—between 36 degrees N latitude and Point Ano Nuevo, or Areas 1-13 of the MBNMS proposal. Areas 14 and 15 in the MBNMS proposal, which are located in the southern portion of the Sanctuary, were negotiated separately and do not represent a consensus by all stakeholders on the appropriate level of protection for the La Cruz Canyon / Piedras Blancas area. Ocean Conservancy, NRDC, and Oceana will be proposing expanded boundary lines for this area, which we believe better account for the high conservation value of the area’s rocky substrate, biogenic habitat, and canyon heads under the EFH mandate. Our proposed boundary lines for the La Cruz Canyon / Piedras Blancas area will connect the areas labeled as 14 and 15 in the MBNMS proposal into a single area, and will encompass more of the surrounding high-value habitat area.

Consistent with our support of the Monterey Bay region of the MBNMS proposal, we will include the polygons identified in the MBNMS proposal (Areas 1 through 13) in our own EFH proposal, as a subset of what we propose. Our proposal will also contain a few additional areas in the Monterey Bay region that are not included in the MBNMS proposal; these areas are the result of separate discussions our organizations have had with fishermen. All additional areas that we propose in the Monterey Bay region will be explained fully in our proposal.

Overall, we view the MBNMS proposal as a step forward that protects additional habitat while maintaining fishing opportunities, and we hope to see the Council’s support and recognition for the consensus areas of modification in the proposal.

Thank you for your consideration, and please feel free to contact any of us if you have questions.

Sincerely,

RE: Support for the Collaborative Groundfish EFH Proposal: Protecting Essential Fish Habitat While Balancing Fishing Opportunities in Monterey Bay National Marine Sanctuary, South of Año Nuevo

Dear Chairman Wolford and Members of the Council,

On behalf of the Monterey Bay Aquarium, I am writing in support of the proposal to modify the Pacific Coast Groundfish Essential Fish Habitat submitted by the Monterey Bay National Marine Sanctuary in collaboration with multiple organizations, including the City of Monterey and conservation groups.

I understand that this proposal adds new closures to protect critical groundfish Essential Fish Habitat, while at the same time, re-opens some areas to restore historically trawled areas of importance to trawl fishermen. In addition, the proposal puts forward concepts on voluntary management areas and changes to enforcement of spatial closures.

I am particularly pleased to support this proposal because it is the result of careful and respectful dialogue, negotiation and compromise among regulating agencies, environmental organizations and fishermen. This kind of regional collaboration is encouraging, hopeful and necessary to develop solutions to the complex coastal and ocean policy decisions before us.

In summary, we fully support the Collaborative Groundfish EFH proposal put forward by the Monterey Bay National Marine Sanctuary and the participating organizations. The proposal will help lay a foundation for a sustainable fishing future for our region that balances conservation with economic opportunity, as well as encourage future collaborative research and stewardship activities in and around the Monterey Bay.

Sincerely,

A handwritten signature in black ink that reads "Julie Packard".
